BACKGROUND AND INTRODUCTION

In 2002, the Monterey County Water Resources Agency (Agency) Board of Directors certified the Final EIR/EIS and applied to the U.S. Army Corps of Engineers (Corps) for a permit to construct the Salinas Valley Water Project (SVWP). The SVWP consists of three components:

1. The Nacimiento Dam Spillway Modification.
2. Reoperation of Nacimiento and San Antonio reservoirs.
3. The Salinas River Diversion Facility (SRDF).

The Agency coordinated construction of the SVWP from 2008 through 2010. The project was the culmination of multiple decades of planning, engineering and public involvement. The objectives of the SVWP are to:

- halt seawater intrusion;
- provide adequate water supplies to meet current and future (2030) water needs; and,
- improve the hydrologic balance of the Salinas Valley Groundwater Basin.

During the permitting process for the SVWP, the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS) initiated a formal Section 7 consultation with the Corps on the issuance of a permit for the SVWP. This consultation resulted in the Agency authoring the *Salinas Valley Water Project Flow Prescription for Steelhead Trout* (Flow Prescription) in 2005 and incorporating it into the project description. The Flow Prescription defines flow requirements and operational targets for managing steelhead trout (*Oncorhynchus mykiss*) in the Salinas River. Three main areas of monitoring are outlined in the Flow Prescription:

1. Quantify the presence of the threatened steelhead trout in the lower Salinas River system (population monitoring).
2. Manage river flows to ensure adequate water for fish passage (migration monitoring).
3. Monitor water quality to determine habitat suitability (habitat monitoring).

The Flow Prescription was incorporated into the 2007 NMFS Biological Opinion.

In a letter dated February 20, 2019, NMFS formally withdrew their 2007 Biological Opinion (BO) and associated incidental take statement. Many of the provisions of the BO were incorporated into the State of California Water Rights licenses and permits held by the Agency. The Agency will continue to operate the SVWP under the terms of the BO and Water Rights until a long-term solution to incidental take can be developed.

This document includes reporting items originally identified in the NMFS BO. Specifically, Section X, Incidental Take Statement; Subsection D, Terms and Conditions; Item 21.a (Fish Passage), 21.b (Fish Screens), and 21.c (Fish Relocation).

Figure 1 shows the location of facilities and data collection points referenced in this report. *Table 1* summarizes data included in this report.

Data analyzed and presented in this report includes United States Geological Survey (USGS) real-time stream flow data (*Appendix A*) and USGS approved and USGS provisional mean daily stream flow data (*Appendix B*). Operationally, decisions are made in real time based on field measurements, field estimates, forecasted stream flow information from the National Weather Service California Nevada River Forecast Center, and USGS provisional real-time data and mean daily stream flow data.

The Agency continually evaluates USGS provisional stream flow data, in its ongoing effort to make operational decisions necessary to meet targets established in the BO and Flow Prescription. Therefore, in reporting compliance, the Agency is first evaluating its success at meeting these targets utilizing provisional data. Further, USGS stream flow data has an established accuracy of plus or minus 10 percent. The Agency manages the system to respond to triggers and provide passage flows that are within 10 percent of the minimum targets as reported at the USGS stream flow stations. Therefore, Agency operations based on provisional data may not coincide with approved published USGS data.

USGS stream flow data typically is approved and published up to one year after the water year (WY) for which it is computed. This report includes real-time stream flow, approved

and provisional USGS mean daily stream flow, reservoir storage and releases, and Salinas River Lagoon data for the period from October 1, 2018 through October 23, 2019.

2019 OPERATIONAL SEASON

The 2019 operational season began on April 1, 2019. On that date the gates were raised, the impoundment of water began, pump testing occurred and diversions commenced.

YEAR-TYPE DETERMINATION

Year-type is based on the exceedance probability (relative to the period of record) of the annual mean stream flow in cubic feet per second (cfs) at the USGS stream gage Arroyo Seco near Soledad and is forecast for the current water year on March 15 and April 1. Using provisional data from that gage, year-type forecasts were completed on March 15, 2019 (forecasting a mean annual flow of 344 cfs) and again on April 1, 2019 (forecasting a mean annual flow of 326 cfs). Period of record data for the year-type analysis incorporated the most recently published USGS data, spanning the period WY 1902 through WY 2017. Both forecasts resulted in a year-type determination of “Wet” (*Figure 2*). Agency staff notified the NMFS Santa Rosa office of the year-type forecasts on March 15 and April 1, 2019. Subsequent evaluation of approved USGS data for the stream gage Arroyo Seco near Soledad indicated an annual mean stream flow of 305 cfs, confirming the accuracy of the year type determination forecast of “Wet” (see *Figure 2*, “Year Type Determination”).

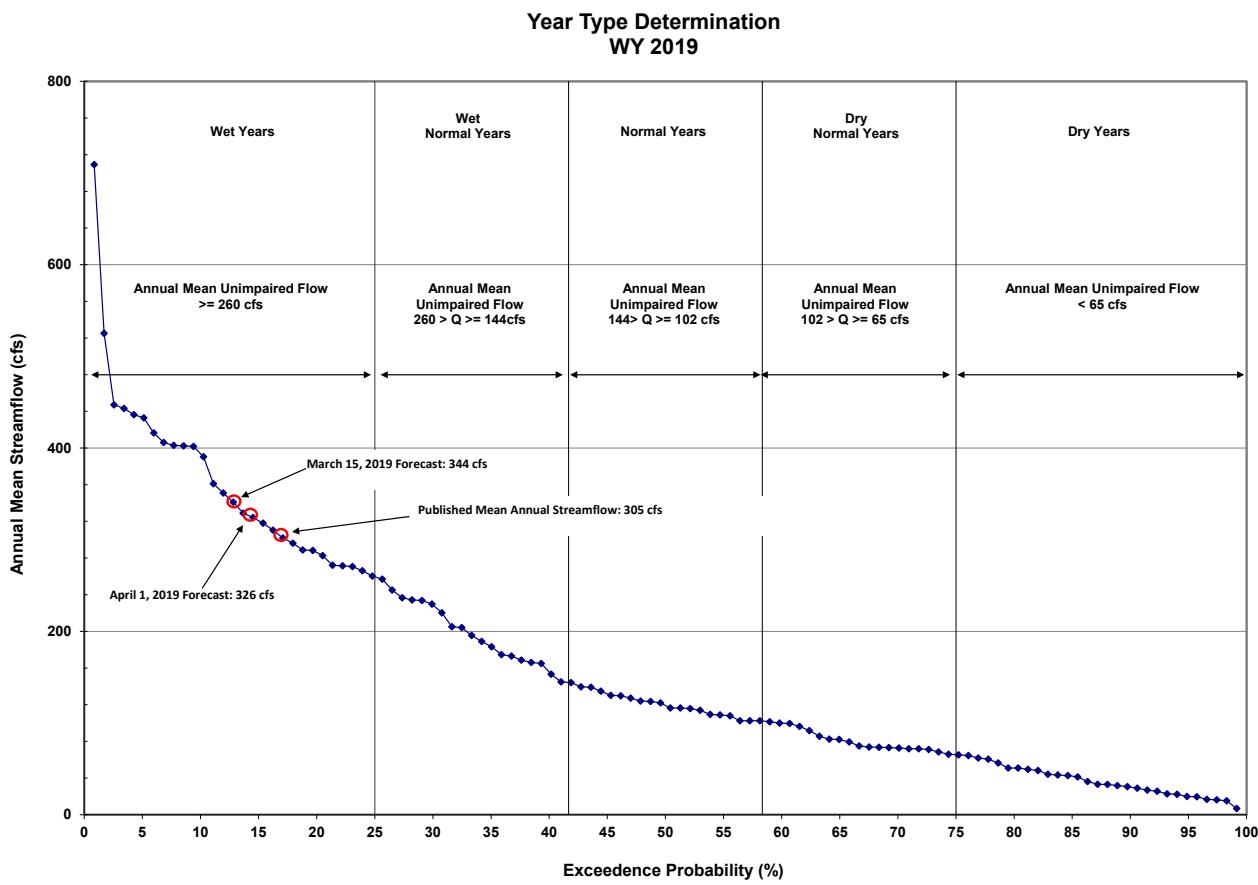

Figure 2. Exceedance Probability for Water Years 1902 through 2017 of annual mean stream flow for Arroyo Seco (Based on approved USGS data for Arroyo Seco near Soledad) defining Year Types: Wet, Wet Normal, Normal, Dry Normal, and Dry. Arroyo Seco near Soledad mean annual stream flow forecast on March 15 and April 1 along with mean annual stream flow calculated from subsequently approved USGS data.

ADULT STEELHEAD UPSTREAM MIGRATION

The adult steelhead upstream passage season on the mainstem of the Salinas River, for the purpose of monitoring and recording passage conditions, is defined as beginning on January 1 and continuing through March 31. Adult steelhead upstream passage conditions are defined in the Flow Prescription as *“five or more consecutive days of a mean daily stream flow of at least 260 cubic feet per second (cfs) as measured at the USGS stream flow gage Salinas River near Chualar, when the Salinas River Mouth at the Salinas River Lagoon is open to the ocean.”*

In January these passage conditions are met only through natural flows. Beginning on February 1, in all year types, passage conditions may be augmented by releases from Nacimiento and/or San Antonio Reservoirs when the following triggers are met:

- 340 cfs or higher flows are present at the Arroyo Seco near Soledad gage (USGS stream gage 11152000), and
- 173 cfs or higher flows are present at the Arroyo Seco below Reliz Creek gage (USGS stream gage 11152050).

These triggers are active only when the combined storage at Nacimiento and San Antonio reservoirs is at least 220,000 AF, and the Salinas River Mouth at the Salinas River Lagoon is open to the ocean.

Combined storage at both reservoirs exceeded 220,000 AF from February 6 to March 31, 2019 (*Appendix C*) and the Salinas River Mouth at the Salinas River Lagoon was open to the ocean from January 19 until June 28, 2019 (*Appendix D*).

While adult steelhead upstream passage release triggers were met from February 6 to March 31, continuous natural flows exceeding 260 cfs at the Salinas River near Chualar obviated the need for flow augmentation and no reservoir releases were made to augment natural flows in support of adult steelhead upstream migration in WY 2019.

Between January 20 and March 31, 2019, 56 passage days were tallied based on provisional streamflow data. Subsequently published approved USGS streamflow data documents 61 passage days between January 19 and March 31 and indicates that passage opportunities continued into the month of April. Figure 3 was expanded past the prescribed adult upstream passage window to highlight Salinas River near Chualar flows while the Salinas River Lagoon was open to the ocean.

Figure 3 graphs USGS provisional and USGS approved mean daily flow data illustrating adult steelhead upstream passage conditions that existed in 2019.

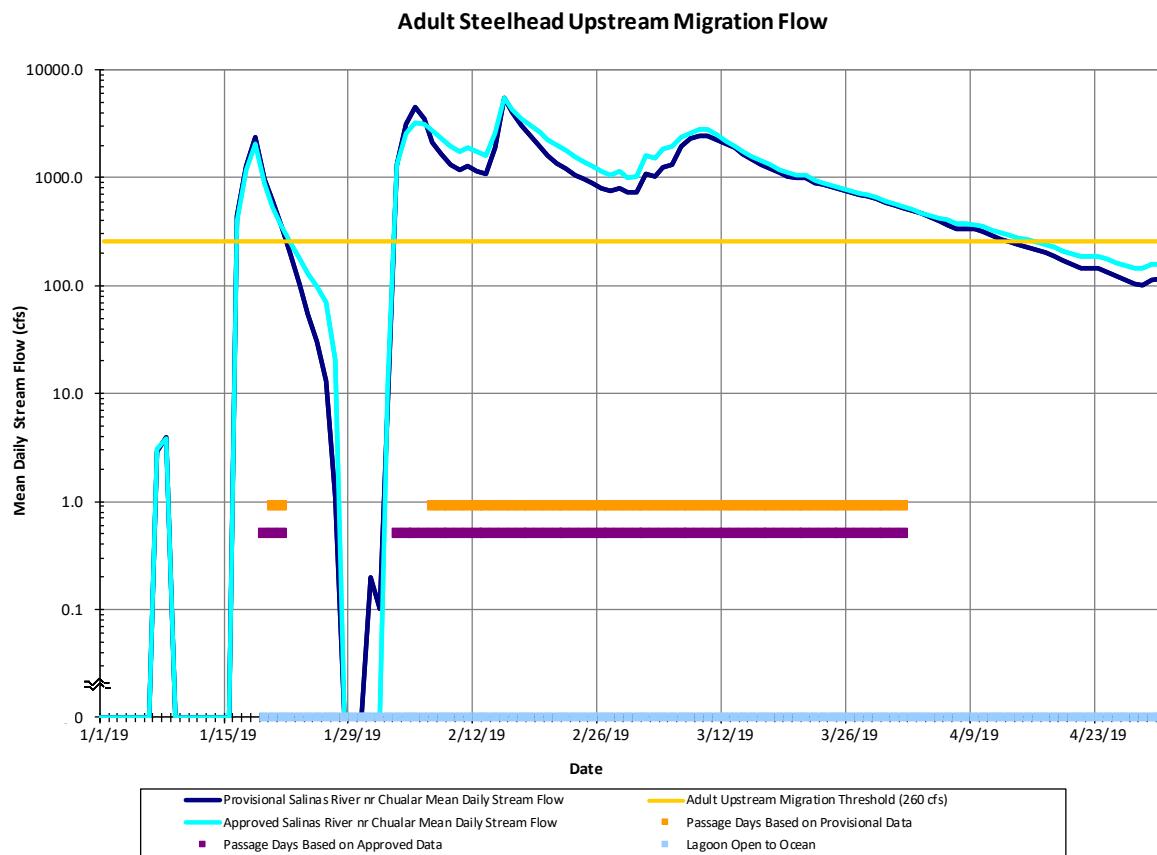

Figure 3. 61 Adult Steelhead Upstream Passage days were logged in 2019

ADULT STEELHEAD UPSTREAM PASSAGE ACHIEVEMENT

In order to ensure adequate adult steelhead upstream migration opportunities, the Agency operates reservoir releases to provide, within a 10 percent variance and averaged over a 10-year period, the cumulative number of annual adult upstream passage days in the lower Salinas River as occurred historically. During normal year types, passage days may be achieved by natural flows or augmentation of natural flows with releases from Nacimiento and/or San Antonio Reservoirs. Little or no adult upstream passage occurred historically in dry years, and wet years, by their nature, provide adequate passage opportunities. Table 2 contains the year type and the number of passage days achieved in each operational year. Table 3 summarizes passage days by year type.

Table 2. Adult Steelhead Upstream Passage Days by Operational Year

Operational Year	Year Type Calculated from Approved USGS Streamflow	Number of Passage Days Required on a 10-year Average (Normal Year Types)	Number of Passage Days Achieved	Reservoir Releases Required to Augment Natural Flows
2010	Wet	N/A	70	No
2011	Wet	N/A	69	No
2012	Dry	N/A	0	No
2013	Dry-Normal	16	0	No
2014	Dry	N/A	0	No
2015	Dry	N/A	0	No
2016	Dry-Normal	16	0	No
2017	Wet	N/A	72	Yes
2018	Dry	N/A	0	Yes
2019	Wet	N/A	61	No

Table 3. Adult Steelhead Upstream Passage Days by Year Type (2010-2019)

Year Type	Number of Years per Category	Number of Passage Days Required on a 10-year Average	Average Number of Passage Days Achieved (2010-2019)
Wet	4	N/A	68
Wet-Normal	0	73	N/A
Normal	0	47	N/A
Dry-Normal	2	16	0
Dry	4	N/A	0
All Year Types	10	27	27

BLOCK-FLOW RELEASE

To facilitate the downstream migration of smolts and rearing juvenile steelhead in the Salinas River during “Normal” category water years the Agency provides block flow releases when the following triggers are met between March 15th and May 31st of each “Normal” year.

- Combined storage in Nacimiento and San Antonio reservoirs is 150,000 AF or more on March 15th, and
- Flow of 125 cfs or higher at the USGS stream gage Nacimiento River below Sapaque Creek near Bryson; or,
- Flow of 70 cfs or higher at the USGS stream gage Arroyo Seco below Reliz Creek near Soledad.

If triggered, a block flow would require a mean daily stream flow greater than or equal to 700 cfs at the USGS stream gage Salinas River at Soledad for five consecutive days, followed by an additional 20 to 40 days of a mean daily stream flow greater than or equal to 300 cfs at the USGS stream gage Salinas River near Spreckels.

Year-type forecasts were completed on March 15, 2019 (forecasting a mean annual flow of 343 cfs) and April 1, 2019 (forecasting a mean annual flow of 326 cfs). Both forecasts resulted in a year-type determination of “Wet” (*Figure 2*). No block flow releases were required during the 2019 operational season.

STEELHEAD SMOLT OUTMIGRATION

Steelhead smolts are expected to migrate down the Arroyo Seco and Salinas Rivers to the ocean primarily in April and May, peaking April 1 through May 15, based on migration timing in other Central Coast streams (NMFS verbal communication, 2005).

A precise relationship between stream flow levels and smolt downstream migration has not been determined for the Arroyo Seco and Salinas Rivers. For the Arroyo Seco, flow must reach the Salinas River mainstem during the migration period in order for smolts to migrate successfully. For the Salinas River it is estimated that meeting the minimum upstream migration threshold of 150 cfs at the USGS stream gage Salinas River near Spreckels would provide suitable conditions for adults and the smaller smolts returning to the ocean. Agency analysis of historical data shows that during the peak outmigration period, when flow at the USGS stream gage Arroyo Seco below Reliz Creek near Soledad is 1 cfs or more, flow at the USGS stream gage Salinas River near Spreckels is expected to exceed 148 cfs 95% of the time during “Normal” year-types. Therefore, the minimum flow requirements for steelhead smolt outmigration have been identified in the Flow Prescription as 1 cfs or more at the USGS stream gage Arroyo Seco below Reliz Creek near Soledad and 150 cfs or more at the USGS stream gage Salinas River near Spreckels. An analysis of provisional and approved USGS stream flow data for 2019 indicates that migration opportunities from the Arroyo Seco existed for 55 consecutive days from March 15-May 8, and outmigration targets were met in the Salinas River during the 40 day segment from March 15-April 23, the last 23 of which occurred during the peak outmigration period (*Figure 4*).

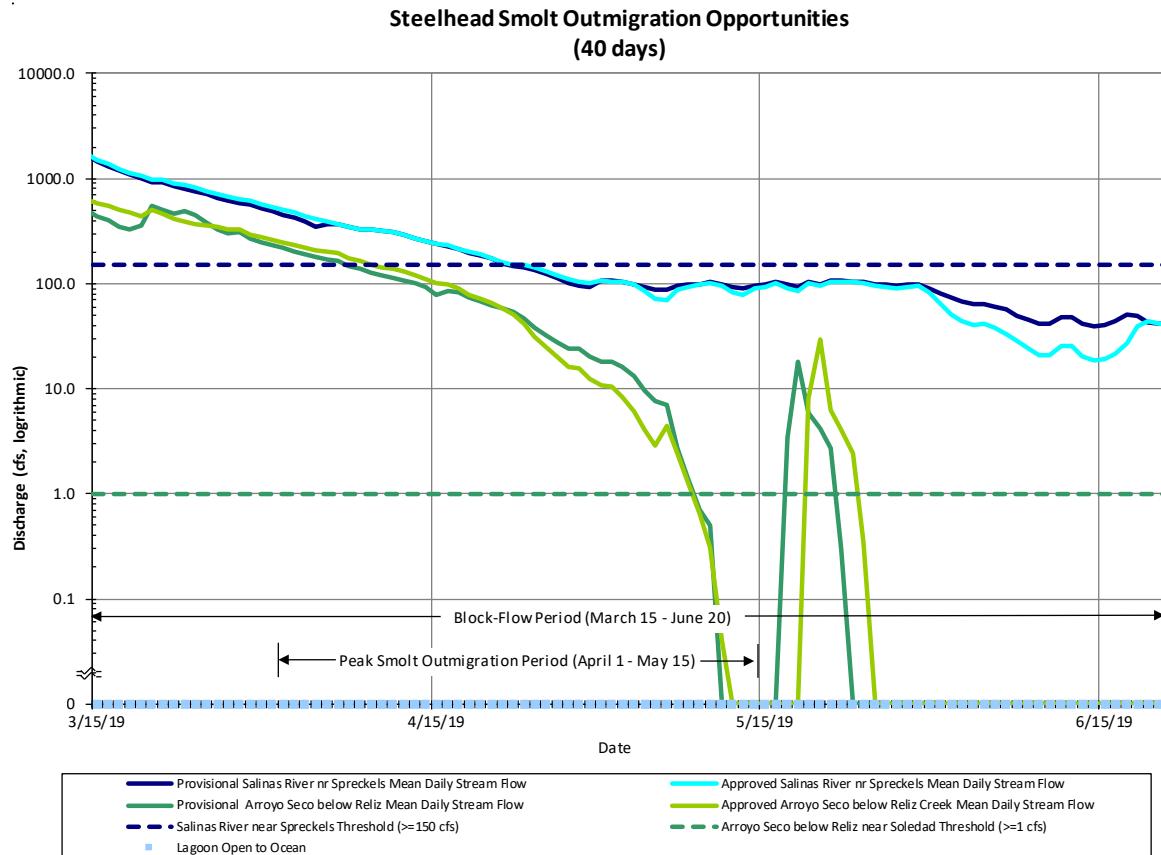

Figure 4. Steelhead Smolt Outmigration Opportunities for 2019

JUVENILE STEELHEAD PASSAGE TO THE SALINAS RIVER LAGOON / LAGOON MAINTENANCE FLOWS

Juvenile steelhead passage flows to the lagoon, as defined by the Flow Prescription, are monitored by the Agency during the period from April 1 through June 30 and overlap with smolt outmigration flow criteria (*Figures 5 and 6*). Lagoon maintenance flows are monitored and regulated as long as SRDF diversions are occurring, or conservation releases from Nacimiento and/or San Antonio reservoirs are being made to the Salinas River. Conservation releases are reservoir releases for the purpose of recharging the groundwater basin.

WY 2019 was identified as a “Wet” year type. When conservation releases are occurring or during SRDF diversion flows, the BO requires that from April 1-June 30, during non-dry water year types when no block flow releases are required and combined reservoir storage is at least 220,000 AF, 45 cfs be maintained to the lagoon for 10 days or as long as it remains open to the ocean to support downstream passage of smolts and kelts. (*Figures 6*). Following this period, a flow to the lagoon of 15 cfs is required through June

30, followed by a minimum of 2 cfs for as long as SRDF diversions are occurring, or conservation releases are being made.

Lagoon flows adhered to the above BO requirements in 2019 and bypass flows of at least 2 cfs were maintained from the time the SRDF impoundment gates were raised through the end of the operational season on September 21, 2019 (Appendix E). Following the end of the operational season, the impoundment was drawn down slowly until all gates were fully lowered on October 23, 2019.

SALINAS RIVER LAGOON WATER SURFACE ELEVATION

Salinas River Lagoon water surface elevation was monitored once or more per week when lagoon elevation was stable and two or more times per week when conditions were less stable.

To supplement visual staff gage readings at the OSR slide gate, recording stage sensors were installed to the same datum at two locations in the Salinas River Lagoon. Stage readings from the Salinas River Lagoon pressure transducer near Monte Road were used in this report. Readings are summarized to daily maximum, minimum, and mean Lagoon elevations and reported in *Appendix D*. Daily maximum and minimum elevations are included to illustrate tidal and river flow influence. The Salinas River Lagoon opened to the ocean on January 19, 2019 and remained open until June 28, 2019.

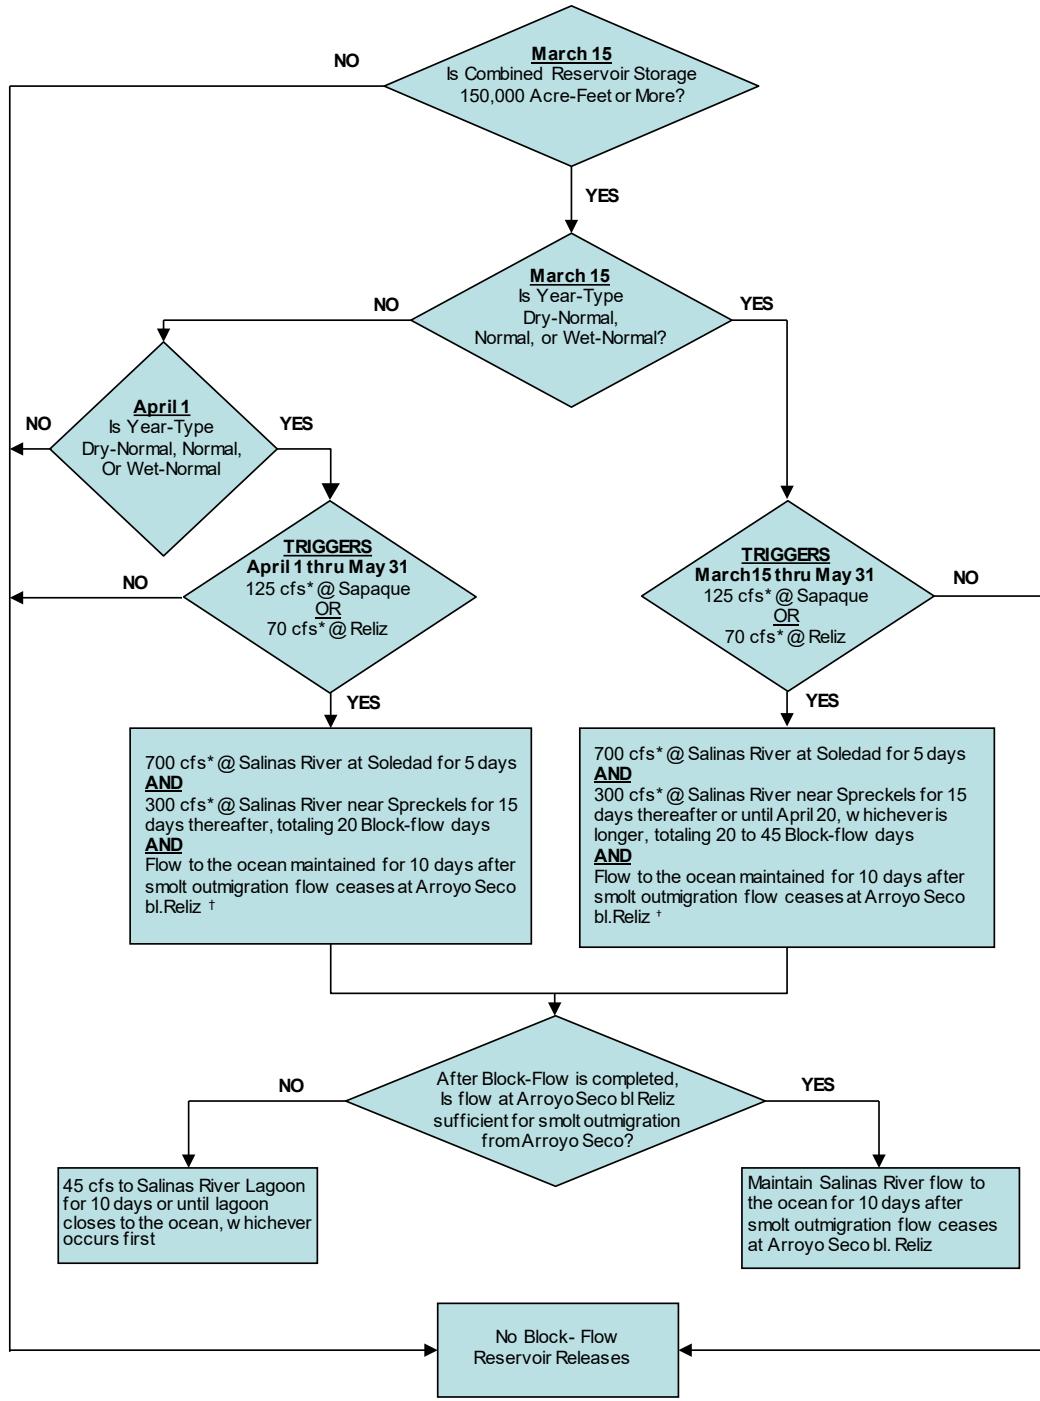

Figure 5. Smolt Outmigration Block-Flow Action Flow Chart (Adapted from Biological Opinion)

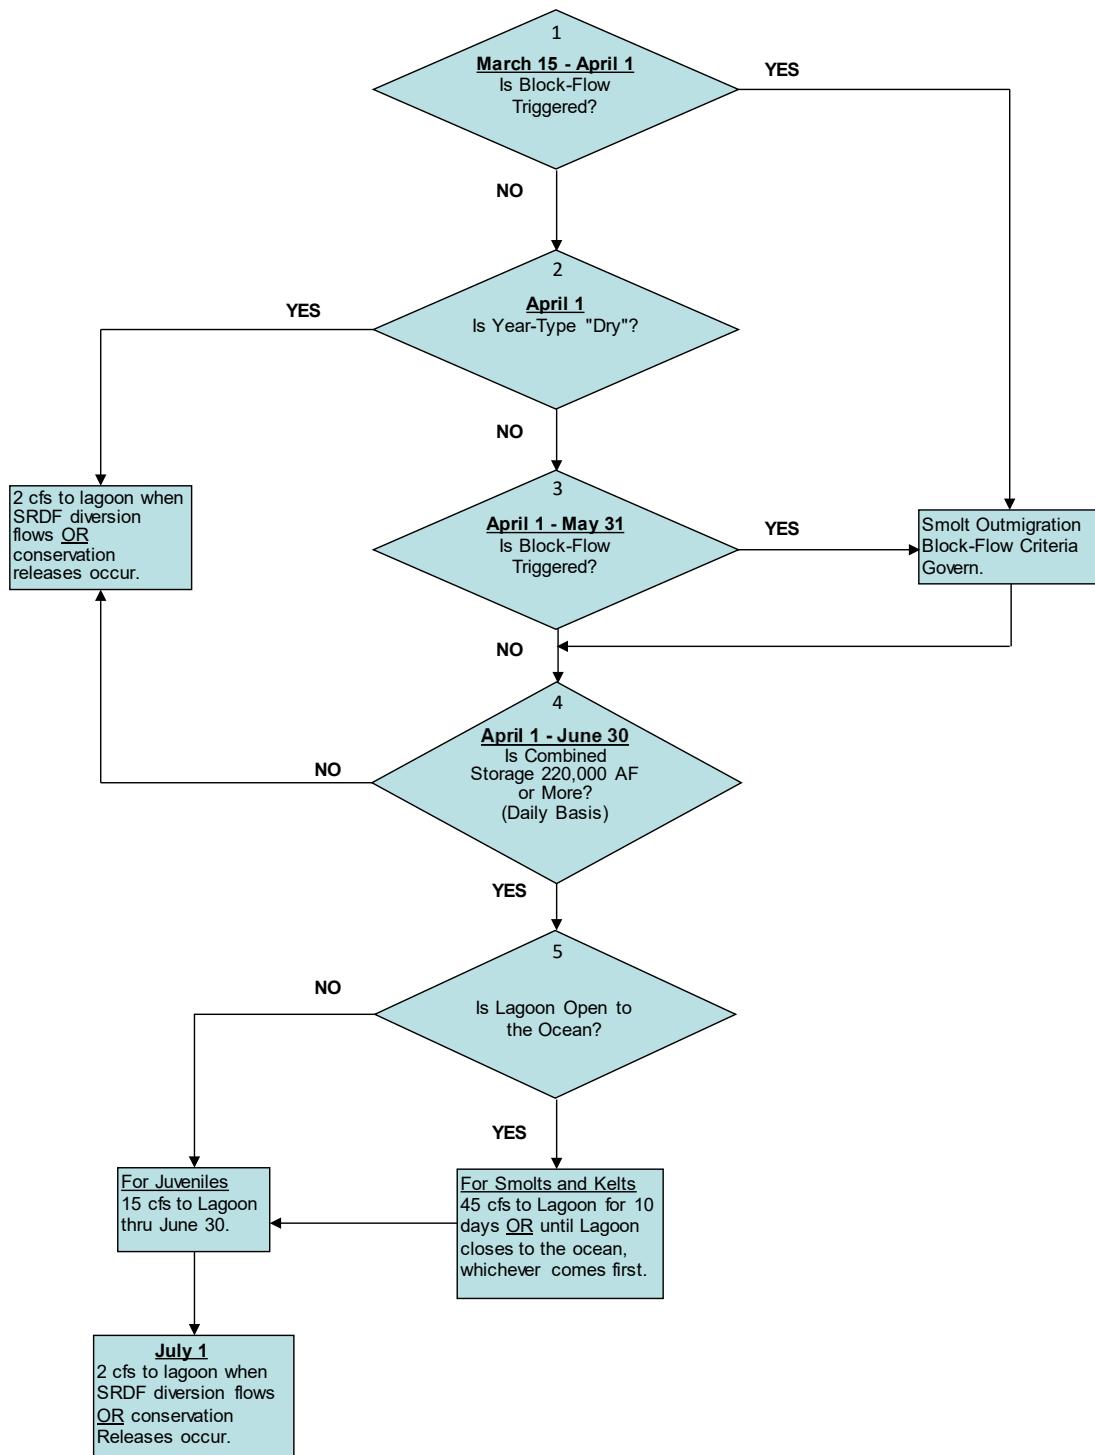

Figure 6. Juvenile Downstream Passage Action Flow Chart (Adapted from Biological Opinion)

MAINTENANCE OF SPAWNING & REARING HABITAT IN THE NACIMIENTO RIVER, BELOW NACIMIENTO DAM

During initial consultations with NMFS it was determined that a flow of 60 cfs as measured at the USGS stream flow gage Nacimiento River below Nacimiento Dam near Bradley would provide adequate spawning habitat in the Nacimiento River below Nacimiento Dam. Until a study and conclusive report on steelhead rearing habitat is performed, the BO has defined 60 cfs as the minimum rearing flow for the Nacimiento River below Nacimiento Dam. Therefore, the minimum release rate from Nacimiento Reservoir will be 60 cfs as long as the reservoir water surface elevation remains above 687.8 feet (msl), the reservoir's minimum pool. According to the SVWP Flow Prescription, during drought conditions when the water surface elevation of Nacimiento Reservoir is below 748 feet, recommendations may be presented to NMFS for a reduction of the minimum flow criterion.

Approved mean daily flow at the Nacimiento River below Nacimiento Dam near Bradley USGS stream gage indicate that spawning and rearing flow requirements (60 cfs +/- 10%) were maintained for the entirety of WY 2019. Provisional and approved mean daily streamflow data are presented in Appendix B.

To prevent steelhead stranding, the Agency minimizes the rate of decline in stage of the Nacimiento River below Nacimiento Dam by decreasing releases by no more than 100 cfs every 4 hours.

On occasion, a scheduled or unscheduled emergency shutdown of the hydroelectric plant or low-level outlets at Nacimiento Dam may result in temporary releases of less than 60 cfs or rates of decline that exceed 100 cfs in four hours. In the case of an unscheduled shutdown, automated backup systems initiate bypass flows of 60 cfs. Appendix C contains a record of daily release rates and release changes for both reservoirs.

ADDITIONAL REPORTING PARAMETERS

Blanco Drain

Monitoring of Blanco Drain discharge to the Salinas River includes mean monthly flows from April through the first significant storm flow of each year. In past years, daily Blanco Drain discharge has been computed using average pump flow values and logged pump run times.

For the entirety of the 2019 operational period, Monterey One Water, the agency charged with Blanco Drain discharge accounting, was constructing a new pump station at the Blanco Drain site. As a result, Blanco Drain discharge could not be tracked and calculated with pump run times as in past years. Instead, Monterey One Water reported an

estimated total volume of water discharged through Blanco Drain (3.168 million gallons, or 9.7 AF) for the entire 2019 operational period. Lacking timeseries data, daily discharge was approximated using a uniform distribution of reported annual volume (*Appendix F*).

SRDF Impoundment Depth/Elevation

SRDF impoundment water depth is continuously monitored during SRDF operations. Channel bottom at the SRDF is approximately at mean sea level (0 msl). Therefore, for the purpose of this report, impoundment depth is equivalent to impoundment elevation. Hourly impoundment elevations are reported in *Appendix G*.

SRDF Fish Ladder Flow Performance Test

When conditions allow, the Agency will perform an annual SRDF fish ladder flow performance test to verify stage-flow characteristics for the full range of SRDF impoundment operational stages. The purpose of this test is to identify flow characteristics through the fish ladder for accurate flow regulation during SRDF operation.

The Agency enlisted the help of the local USGS Field Office for this performance test in June 2010, September 2012, and again in September 2018. The 2018 measurements confirmed the operational strategy that has been in place since 2013. The Agency will continue to use a minimum bypass set point of seven cfs when releases are being made to the lagoon entirely through the fish ladder. Given the observed level of accuracy of the fish ladder at release rates of less than 10 cfs, a set point of seven cfs will ensure the minimum bypass requirement of two cfs is met. A minimum flow of seven cfs may not be required if releases are being made from the regulating weir.

Fish Screen Installation and Removal / Stream Flow at the SRDF

The SRDF impoundment main gates were raised for the 2019 operational season on April 1, 2019 with a mean daily flow at the Salinas River near Spreckels of 500 cfs. Bypass flows were made through the fish ladder while the impoundment was being raised. SRDF pumping operations began the same day, April 1, 2019.

SRDF diversions ceased for the 2019 operational season on September 21, 2019. As required by the BO, the SRDF impoundment was full at the end of the diversion season and was gradually drained using the regulating weir over a period of 28 days. The main impoundment gates were lowered on October 23, 2019, with a mean daily stream flow of 0 cfs recorded at the Salinas River near Spreckels on that date.

Fish Relocation

No relocation of fish from the SRDF fish ladder or impoundment was required during the 2019 operational period.

Notes:

Gaged Total Bypass Flow includes Fish Ladder and Regulating Weir flow but not spill over the main Impoundment Gate.

"N/A" signifies data not available due to equipment failure.

SRDF Impoundment gates were raised and pumping began on April 1, 2019. Pumping ended on September 21, 2019.

Notes:

Impoundment gates were raised April 1, 2019.

The impoundment gates were lowered on October 23, 2019.

Stage values represent the first valid data point of each hour.

Values flagged "e" are estimated.

Appendix G. SRDF Impoundment Elevation Data.

Notes:

Impoundment gates were raised April 1, 2019.

The impoundment gates were lowered on October 23, 2019.

Stage values represent the first valid data point of each hour.

Values flagged "e" are estimated.

Appendix G. SRDF Impoundment Elevation Data.

Notes:

Impoundment gates were raised April 1, 2019.

The impoundment gates were lowered on October 23, 2019.

Stage values represent the first valid data point of each hour.

Values flagged "e" are estimated.

Appendix G. SRDF Impoundment Elevation Data.

Notes:

Impoundment gates were raised April 1, 2019.

The impoundment gates were lowered on October 23, 2019.

Stage values represent the first valid data point of each hour.

Values flagged "e" are estimated.

Appendix G. SRDF Impoundment Elevation Data.

Notes:

Impoundment gates were raised April 1, 2019.

The impoundment gates were lowered on October 23, 2019.

Stage values represent the first valid data point of each hour.

Values flagged "e" are estimated.

Appendix G. SRDF Impoundment Elevation Data.

Notes:

Impoundment gates were raised April 1, 2019.

The impoundment gates were lowered on October 23, 2019.

Stage values represent the first valid data point of each hour.

Values flagged "e" are estimated.
