## INTRODUCTION

---

### Introduction

This report presents the results of TJKM's traffic impact analysis of the proposed September Ranch Subdivision, to be located on Carmel Valley Road in Monterey County. The purpose of this traffic study is to evaluate the potential traffic impacts, identify short-term and long-term roadway and circulation needs, determine potential mitigation measures, and identify any critical traffic issues that should be addressed in the on-going planning process.

### Project Description

The proposed project consists of 95 single-family detached homes and 15 inclusionary (affordable) housing units on a vacant lot. The project site is located on the north side of Carmel Valley Road, across street from Brookdale Drive in Carmel Valley (see Figure 1). The project will have one access road, called September Ranch Road, which will connect and form the fourth (north) leg at the existing Carmel Valley Road/Brookdale Drive intersection. There is an existing driveway located in the vicinity of the proposed Equestrian Center; upon the completion of the project, this driveway will serve as an emergency vehicle access (EVA). Figure 2 shows the proposed project site plan.

### Study Intersections

The study focused on evaluating conditions at ten study intersections that may potentially be impacted by the proposed project (see Figure 1):

1. Highway 1/Carpenter Street
2. Highway 1/Ocean Avenue/Carmel Hills Drive
3. Highway 1/Carmel Valley Road
4. Highway 1/Rio Road
5. Carmel Valley Road/Carmel Rancho Boulevard/Carmel Knolls Drive
6. Carmel Valley Road/Rancho San Carlos Road
7. Carmel Valley Road/Brookdale Drive/Project Driveway
8. Carmel Valley Road/Dorris Drive
9. Carmel Valley Road/Laureles Grade
10. Highway 68/Laureles Grade

Four analysis scenarios were evaluated as part of this study:

- *Existing Conditions* - Current traffic volumes and roadway conditions
- *Existing plus Project Conditions* - Existing turning movement volumes with the addition of the proposed project trips
- *Existing plus Project plus Approved plus Pending Conditions* - Current traffic volumes with the addition of future traffic generated by the proposed project, as well as trips generated by nearby approved and pending projects

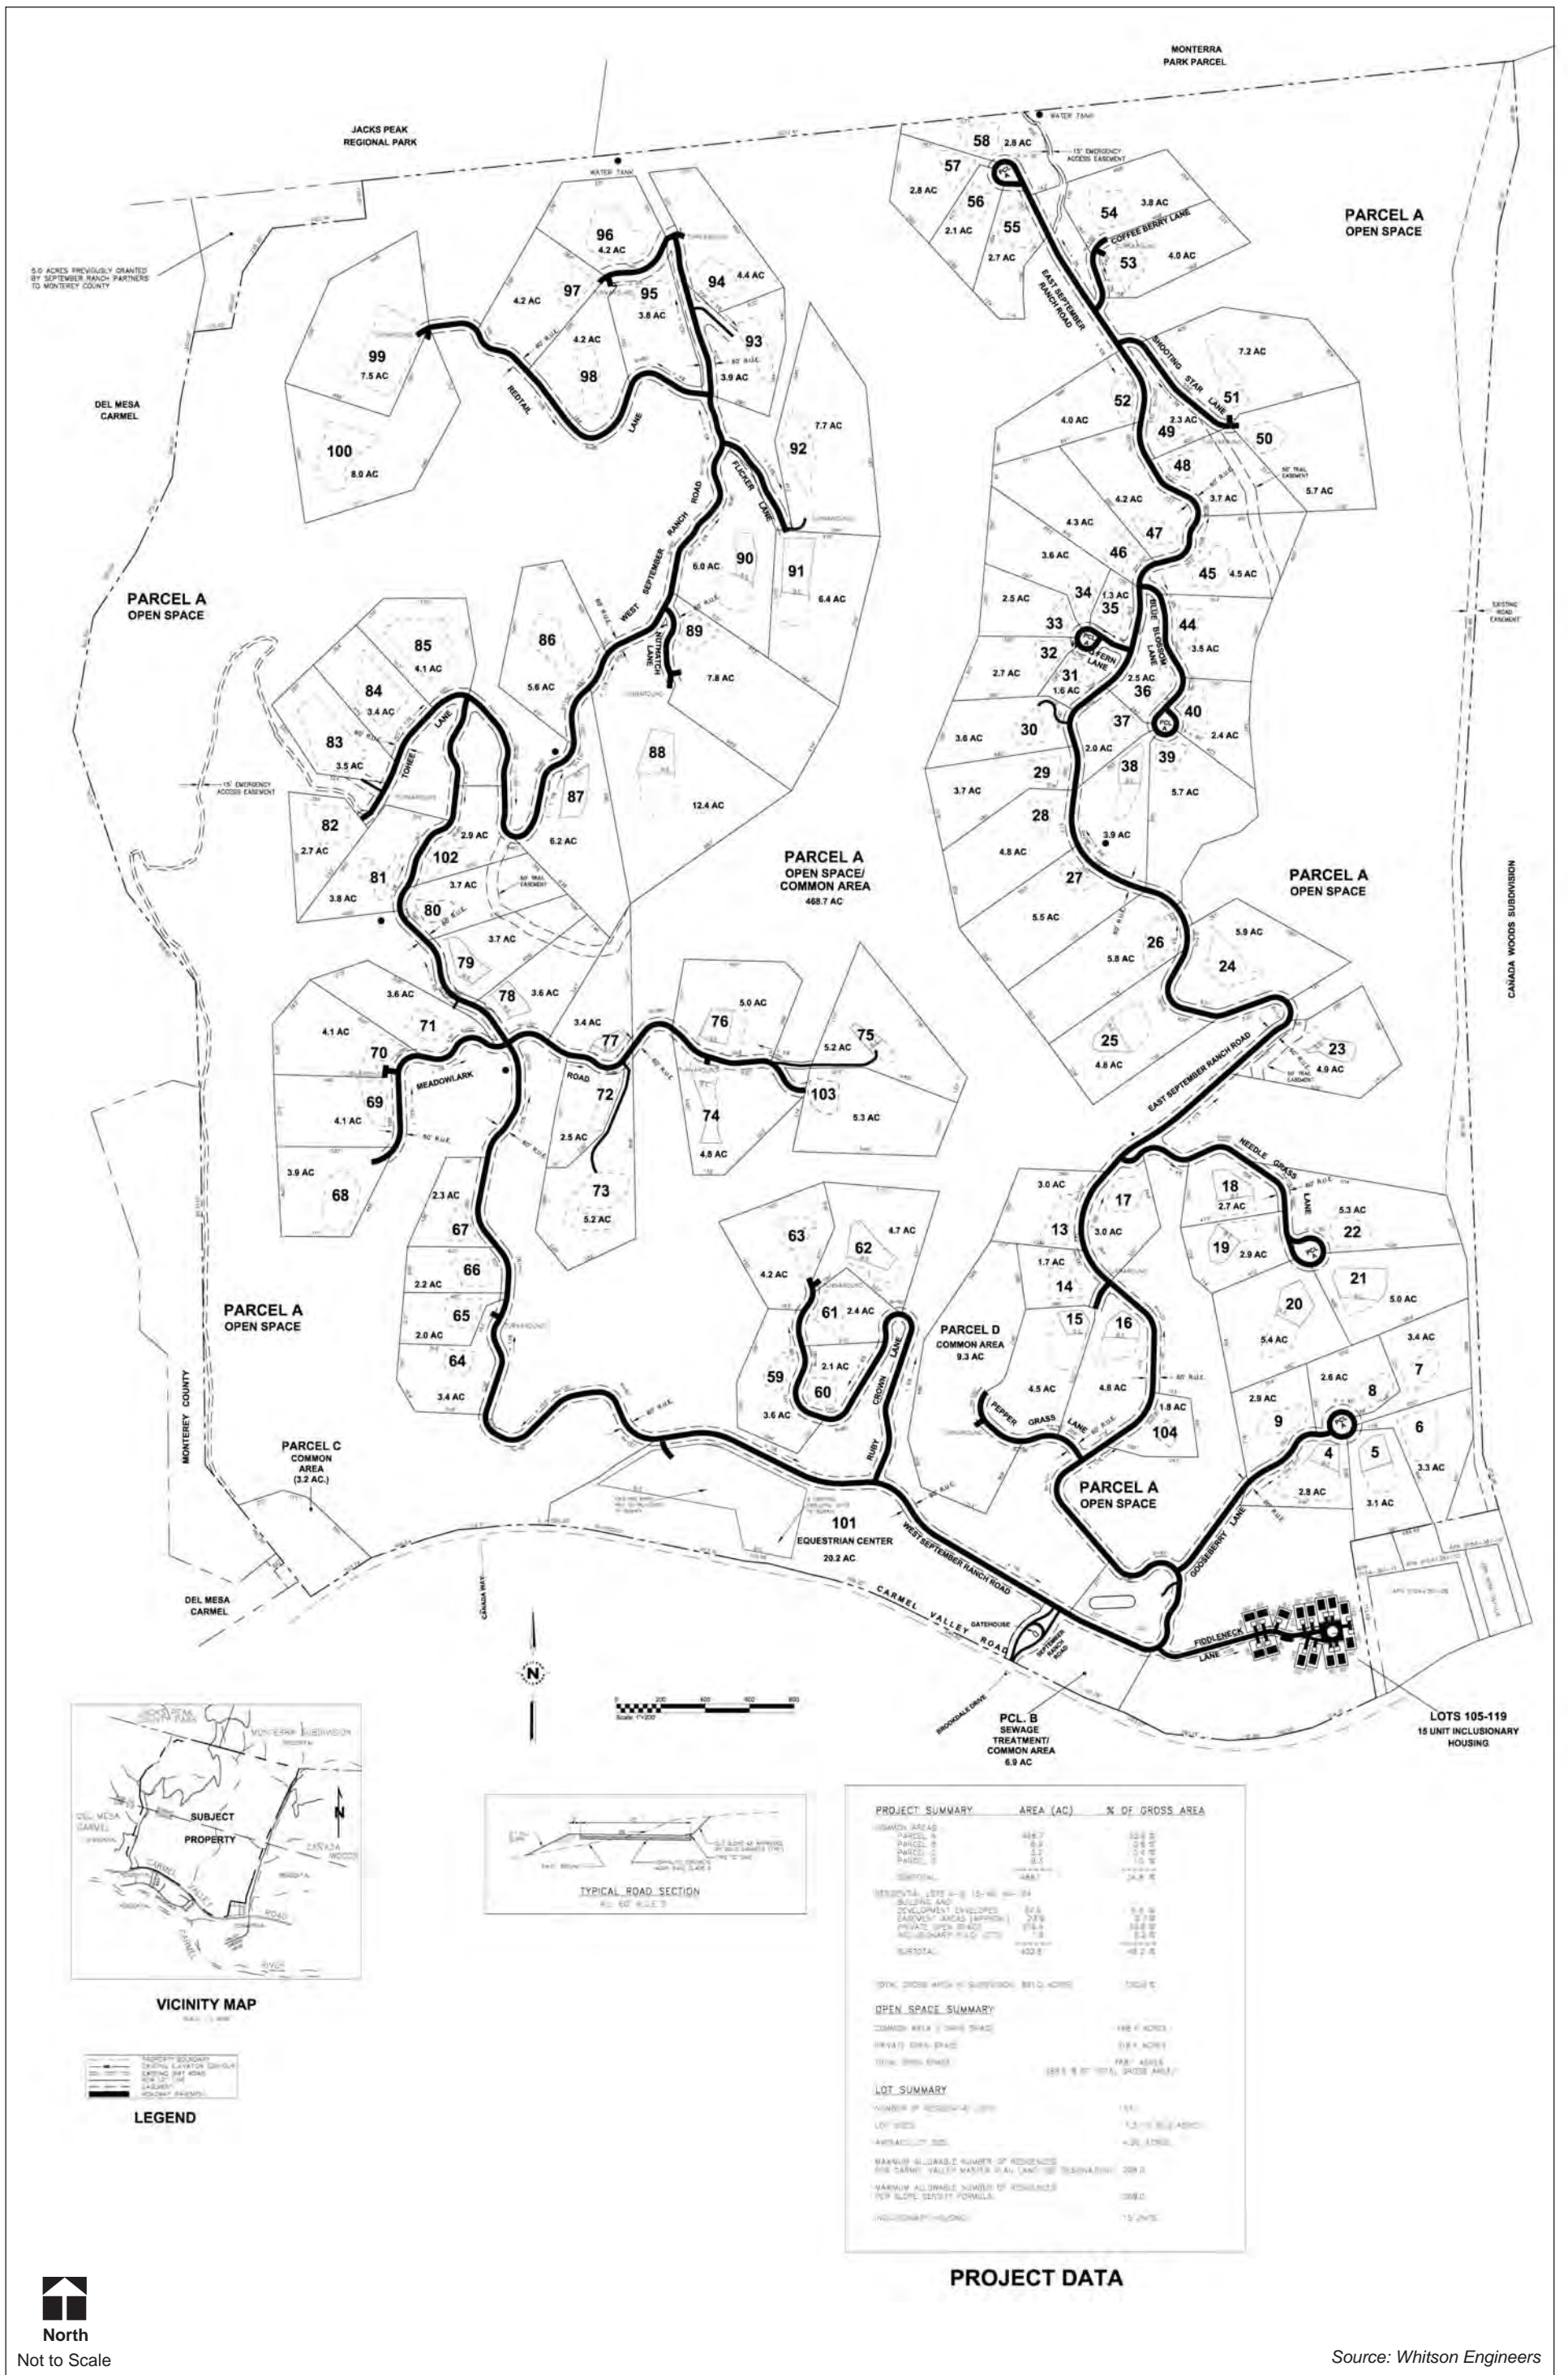

Monterey County  
September Ranch  
**Vicinity Map**

**Figure**  
**1**

- *Cumulative (Year 2025) Conditions* – Year 2025 buildout traffic volumes in accordance with the general plan of the Monterey County with the proposed project trips.

## **Summary**

Under the Existing conditions, the following five study intersections currently operate at unacceptable service levels:

- Highway 1/Carpenter Street (signalized)
- Highway 1/Ocean Avenue/Carmel Hills Drive (signalized)
- Carmel Valley Road/Brookdale Drive (STOP controlled)
- Carmel Valley Road/Dorris Drive (STOP controlled)
- Carmel Valley Road/Laureles Grade (STOP controlled)

Signal modifications would mitigate the congestion problem at Highway 1/Carpenter Street. The Highway 1/Ocean Avenue/Carmel Hills Drive intersection requires widening of the eastbound and westbound approaches to include one left-turn lane, one shared left-turn/through lane, and one right-turn lane. The remaining three intersections require signalization.

Under the Existing plus Project conditions, the same five study intersections are expected to continue to operate unacceptably, and the same measures identified under Existing conditions are expected to be sufficient to mitigate operational issues at these intersections.

The intersections of Highway 1/Carpenter Street and Highway 1/Ocean Avenue/Carmel Hills Drive are expected to continue to operate unacceptably under the Existing plus Project plus Approved plus Pending and the Cumulative Year 2025 scenarios. They would require signal modifications and intersection widening as identified herein. Similarly, the intersections of Carmel Valley Road/Brookdale Drive, Carmel Valley Road/Dorris Drive, and Carmel Valley Road/Laureles Grade are expected to continue to operate unacceptably. Signalization would mitigate the operational problems at these intersections.

The operating conditions of the Highway 1/Rio Road and Highway 68/Laureles Grade intersections are expected to worsen to an unacceptable service level under Cumulative Year 2025 scenario. Recommended mitigation for these intersections is provided herein.

---

## EXISTING CONDITIONS

---

### Existing Roadway System

Access to the project site will be via *Carmel Valley Road*, which is a major two-lane rural highway in Carmel Valley. It extends easterly from Highway 1, providing access to various types of developments including residential, commercial, schools and golf courses. Carmel Valley Road begins at Highway One and ends at Arroyo Seco Road. The major cross streets include Highway 1, Carmel Rancho Boulevard, and Laureles Grade. The posted speed limit on Carmel Valley Road varies between 45 miles per hour (mph) and 55 mph. Class II bike lanes exist along Carmel Valley Road between Carmel Rancho Boulevard and Dorris Drive.

*Highway 1* is one of the major highways in Monterey County. It runs in a north-south direction, and provides regional access to Monterey Bay and San Francisco Bay to the north, and Big Sur and San Luis Obispo to the south. Traffic conditions on Highway 1 in Carmel Valley are often congested with long delays during the peak hours.

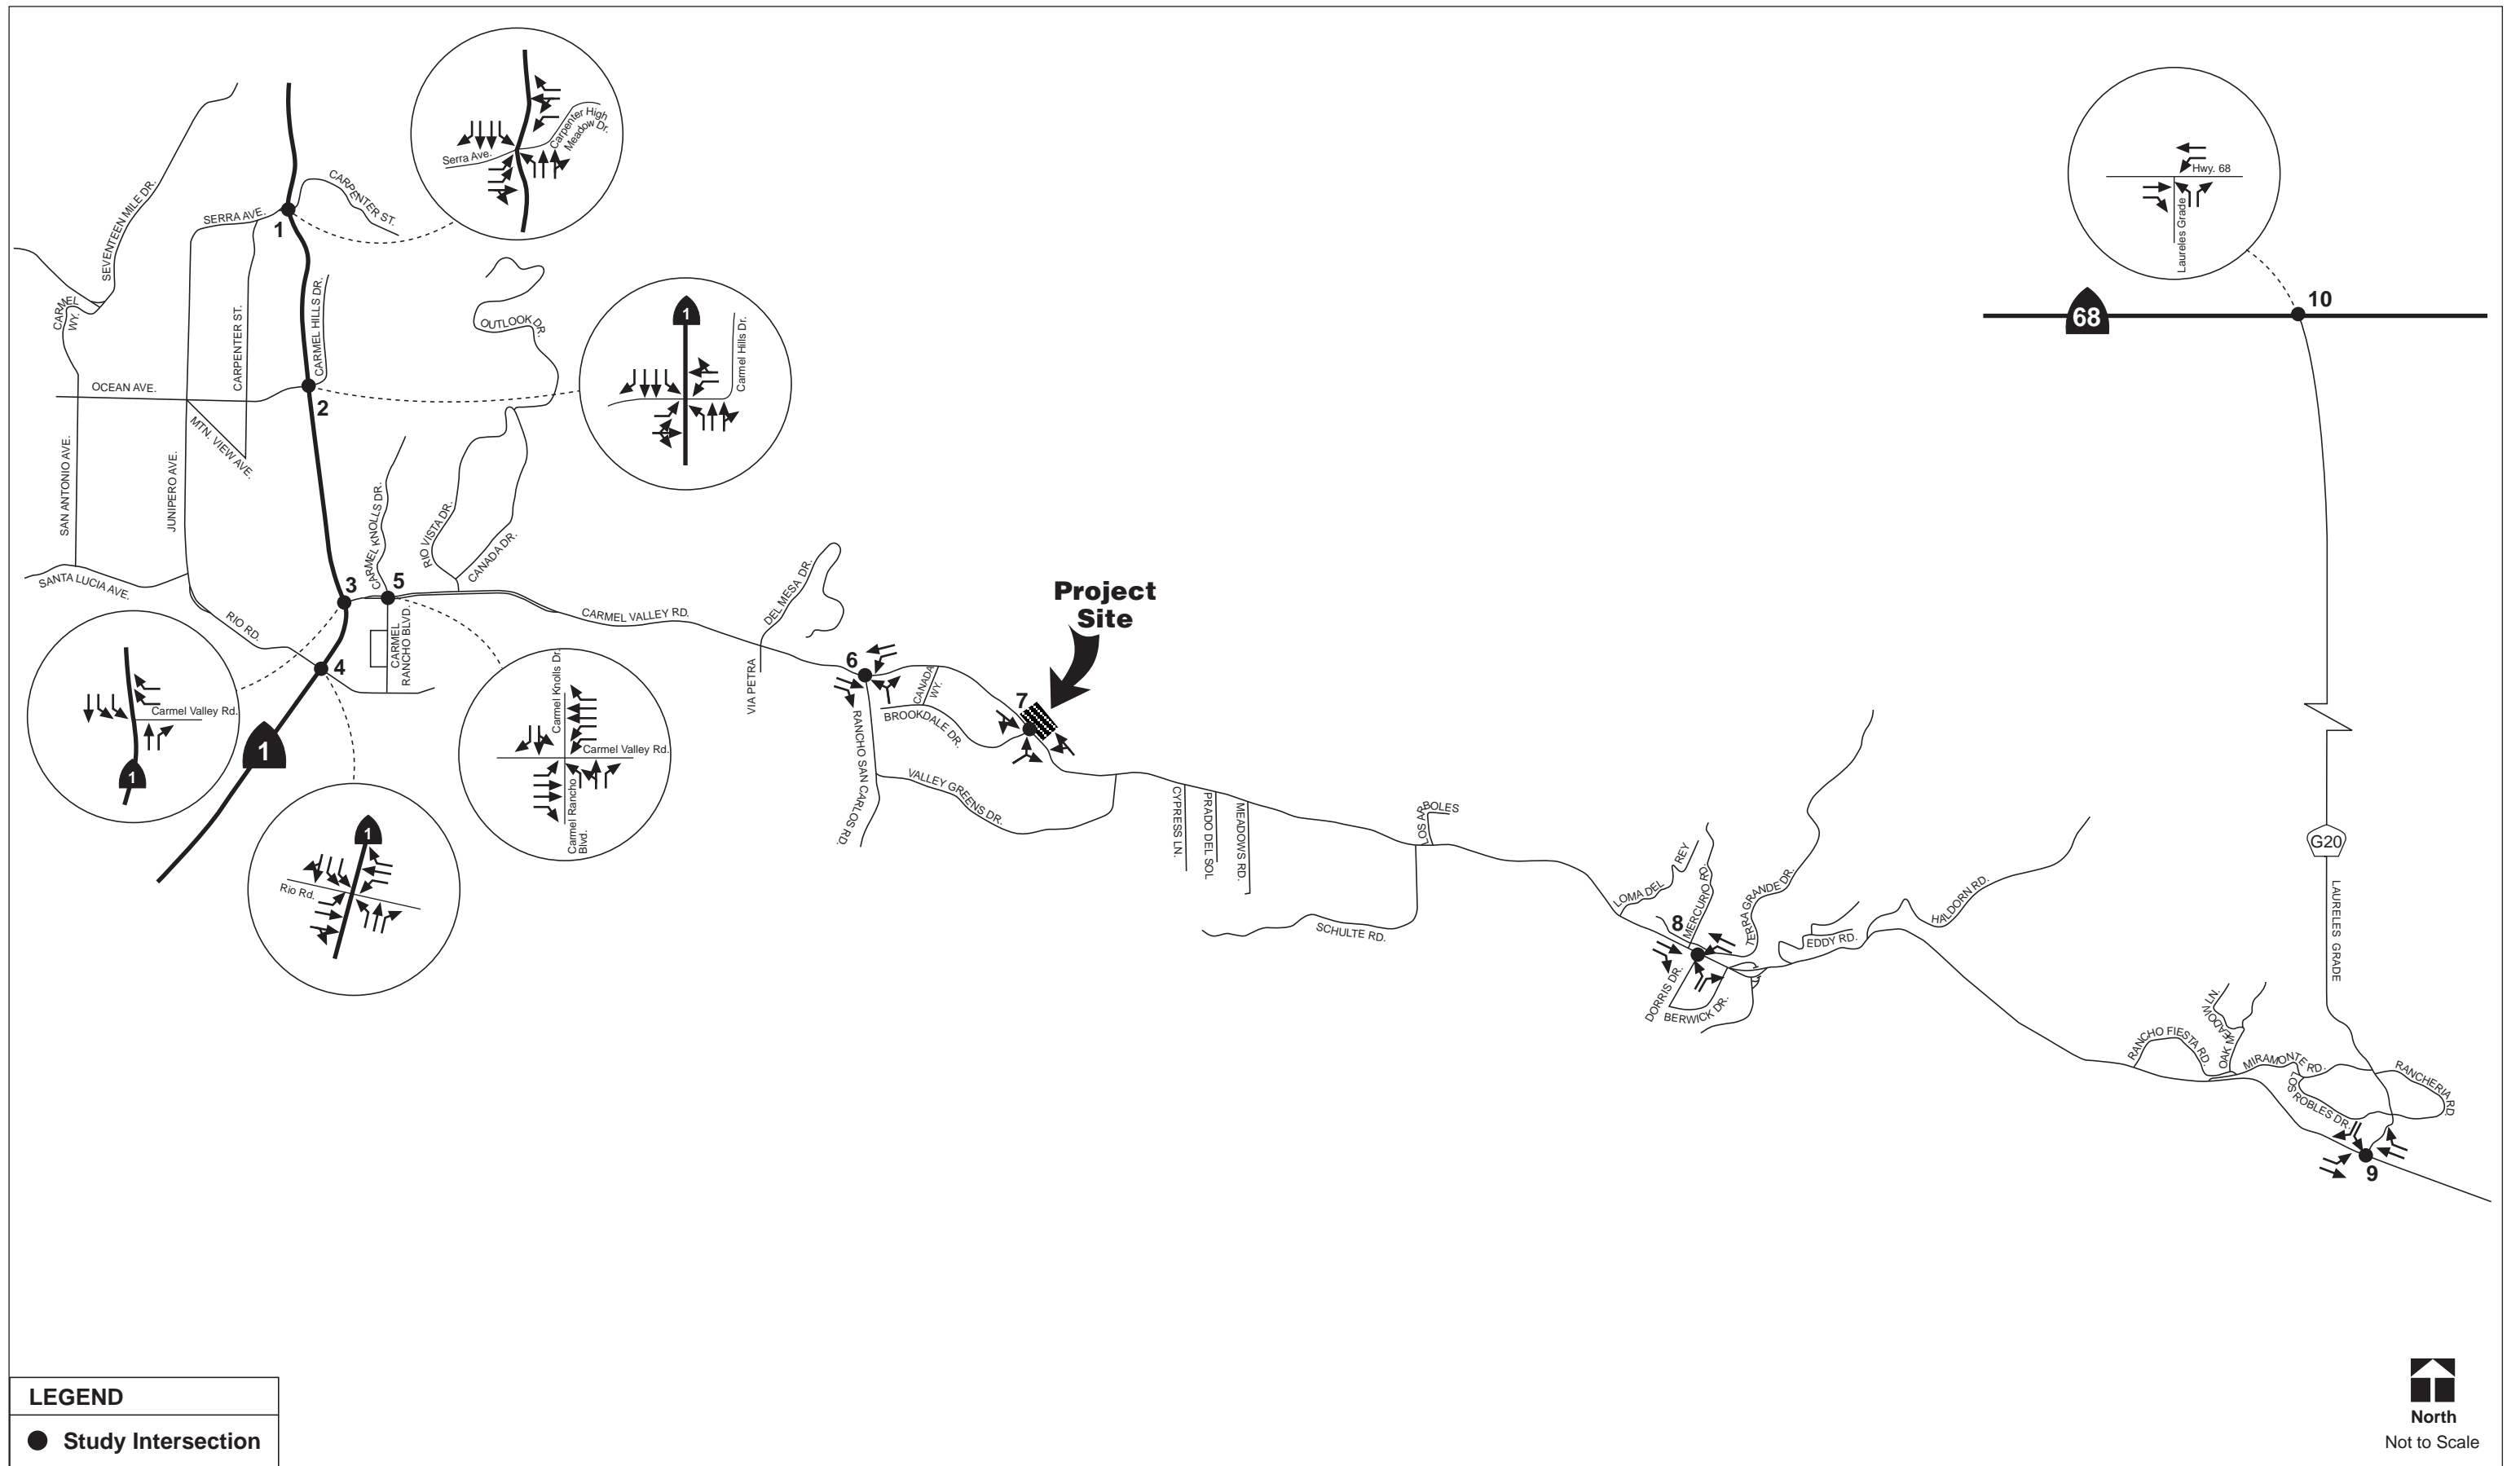

*Carmel Rancho Boulevard* is a four-lane north-south arterial that provides access to the major commercial/service area located south of Carmel Valley Road.

*Laureles Grade* is a two-lane rural highway in Monterey County. It runs in the north-south direction, and connects Carmel Valley Road to Highway 68, which runs through the City of Salinas.

The study focused on the following ten intersections:

1. Highway 1/Carpenter Street
2. Highway 1/Ocean Avenue/Carmel Hills Drive
3. Highway 1/Carmel Valley Road
4. Highway 1/Rio Road
5. Carmel Valley Road/Carmel Rancho Boulevard/Carmel Knolls Drive
6. Carmel Valley Road/Rancho San Carlos Road
7. Carmel Valley Road/Brookdale Drive/Project Driveway
8. Carmel Valley Road/Dorris Drive
9. Carmel Valley Road/Laureles Grade
10. Highway 68/Laureles Grade

Figure 3 illustrates the existing lane geometry of the ten study intersections. All four study intersections located on Highway 1 as well as the intersections of Carmel Valley Road/Carmel Rancho Boulevard, Carmel Valley Road/Rancho San Carlos Road and Highway 68/Laureles Grade are controlled by traffic signals. The remaining three intersections on Carmel Valley Road are STOP-controlled on the minor approach.

**Figure**  
**3**

## **Level of Service Analysis Methodology**

Level of service is a qualitative measure that describes operational conditions as they relate to the traffic stream and perceptions by motorists and passengers. The level of service generally describes these conditions in terms of such factors as speed and travel time, delays, freedom to maneuver, traffic interruptions, comfort, convenience and safety. The operational levels of service (LOS) are given letter designations from “A” to “F,” with “A” representing the best operating conditions (free-flow) and “F” the worst (severely congested).

### *Signalized Intersections*

The operating condition at the signalized study intersections were evaluated using the 2000 Highway Capacity Manual Operations Method as incorporated into the standard traffic engineering software package TRAFFIX. Peak hour intersection conditions are reported as average delay per vehicle with corresponding levels of service for the intersection as a whole. LOS “A” indicates free flow conditions with little or no delay, while LOS “F” indicates jammed conditions with excessive delay and long back-ups. The methodology is described in detail in Appendix A.

### *Unsignalized Intersections*

The operating conditions at the study intersections with the minor approaches STOP controlled were evaluated using the 2000 Highway Capacity Manual (HCM) Unsignalized Method, also contained in the standard software package TRAFFIX. Peak hour intersection conditions are reported as delay per vehicle with corresponding LOS for each of its minor movements. The methods rank level of service on an “A” through “F” scale similar to that used for signalized intersections, and also uses average delay in seconds as its measure of effectiveness. The methodologies for unsignalized intersections are also presented in Appendix A.

## **Impact Criteria**

All four intersections on Highway 1 and the intersection of Highway 68/Laureles Grade are under Caltrans jurisdiction. The other five study intersections, all located on Carmel Valley Road, belong to Monterey County. Both Caltrans and the County consider a peak hour LOS “C” to be the limit of acceptable service for the intersections under its jurisdiction. Therefore, the study intersections that fall below LOS C are considered impacted and should be considered for mitigation.

## Results of Level of Service Analysis (Existing)

Turning movement counts at all study intersections were collected in early December of 2002, except for Highway 68/Laureles Grade, which was counted in June of 2003. The detailed turning count data are provided in Appendix B. Figure 4 illustrates the existing peak hour turning movement volumes at the study intersections. The intersection lane geometry is previously shown in Figure 3. Table I summarizes the results of the intersection analysis under Existing Conditions. The detailed LOS calculations are contained in Appendix C.

**TABLE I: EXISTING LEVELS OF SERVICE**

Intersection	Control	A.M. Peak		P.M. Peak		
		Delay (sec/veh)	LOS	Delay (sec/veh)	LOS	
1	Highway 1/Carpenter St	Signal	22.9	C	<b>39.6</b>	<b>D</b>
	- Utilizing 'overlap' for SB and WB RT	Signal	16.8	B	33.4	C
2	Highway 1/Ocean Ave/Carmel Hills Dr	Signal	24.3	C	<b>79.5</b>	<b>E</b>
	- Widening EB and WB approaches	Signal	17.6	B	33.1	C
3	Highway 1/Carmel Valley Rd	Signal	10.3	B	26.6	C
4	Highway 1/Rio Rd	Signal	22.0	C	24.4	C
5	Carmel Valley Rd/Carmel Rancho Blvd	Signal	15.0	B	22.5	C
6	Carmel Valley Rd/Rancho San Carlos Rd	Signal	11.5	B	9.6	A
7	Carmel Valley Rd/Brookdale Dr	1-Way STOP	- ( <b>57.5</b> )	- ( <b>F</b> )	- ( <b>43.0</b> )	- ( <b>E</b> )
	- Installing a traffic signal	Signal	4.9	A	5.6	A
8	Carmel Valley Rd/Dorris Dr	1-Way STOP	- ( <b>92.3</b> )	- ( <b>F</b> )	- ( <b>62.4</b> )	- ( <b>F</b> )
	- Installing a traffic signal	Signal	7.8	A	8.0	A
9	Carmel Valley Rd/Laureles Grade	1-Way STOP	- ( <b>41.4</b> )	- ( <b>E</b> )	- ( <b>36.4</b> )	- ( <b>E</b> )
	- Installing a traffic signal	Signal	10.8	B	12.5	B
10	Highway 68/Laurelres Grade	Signal	20.2	C	17.4	B

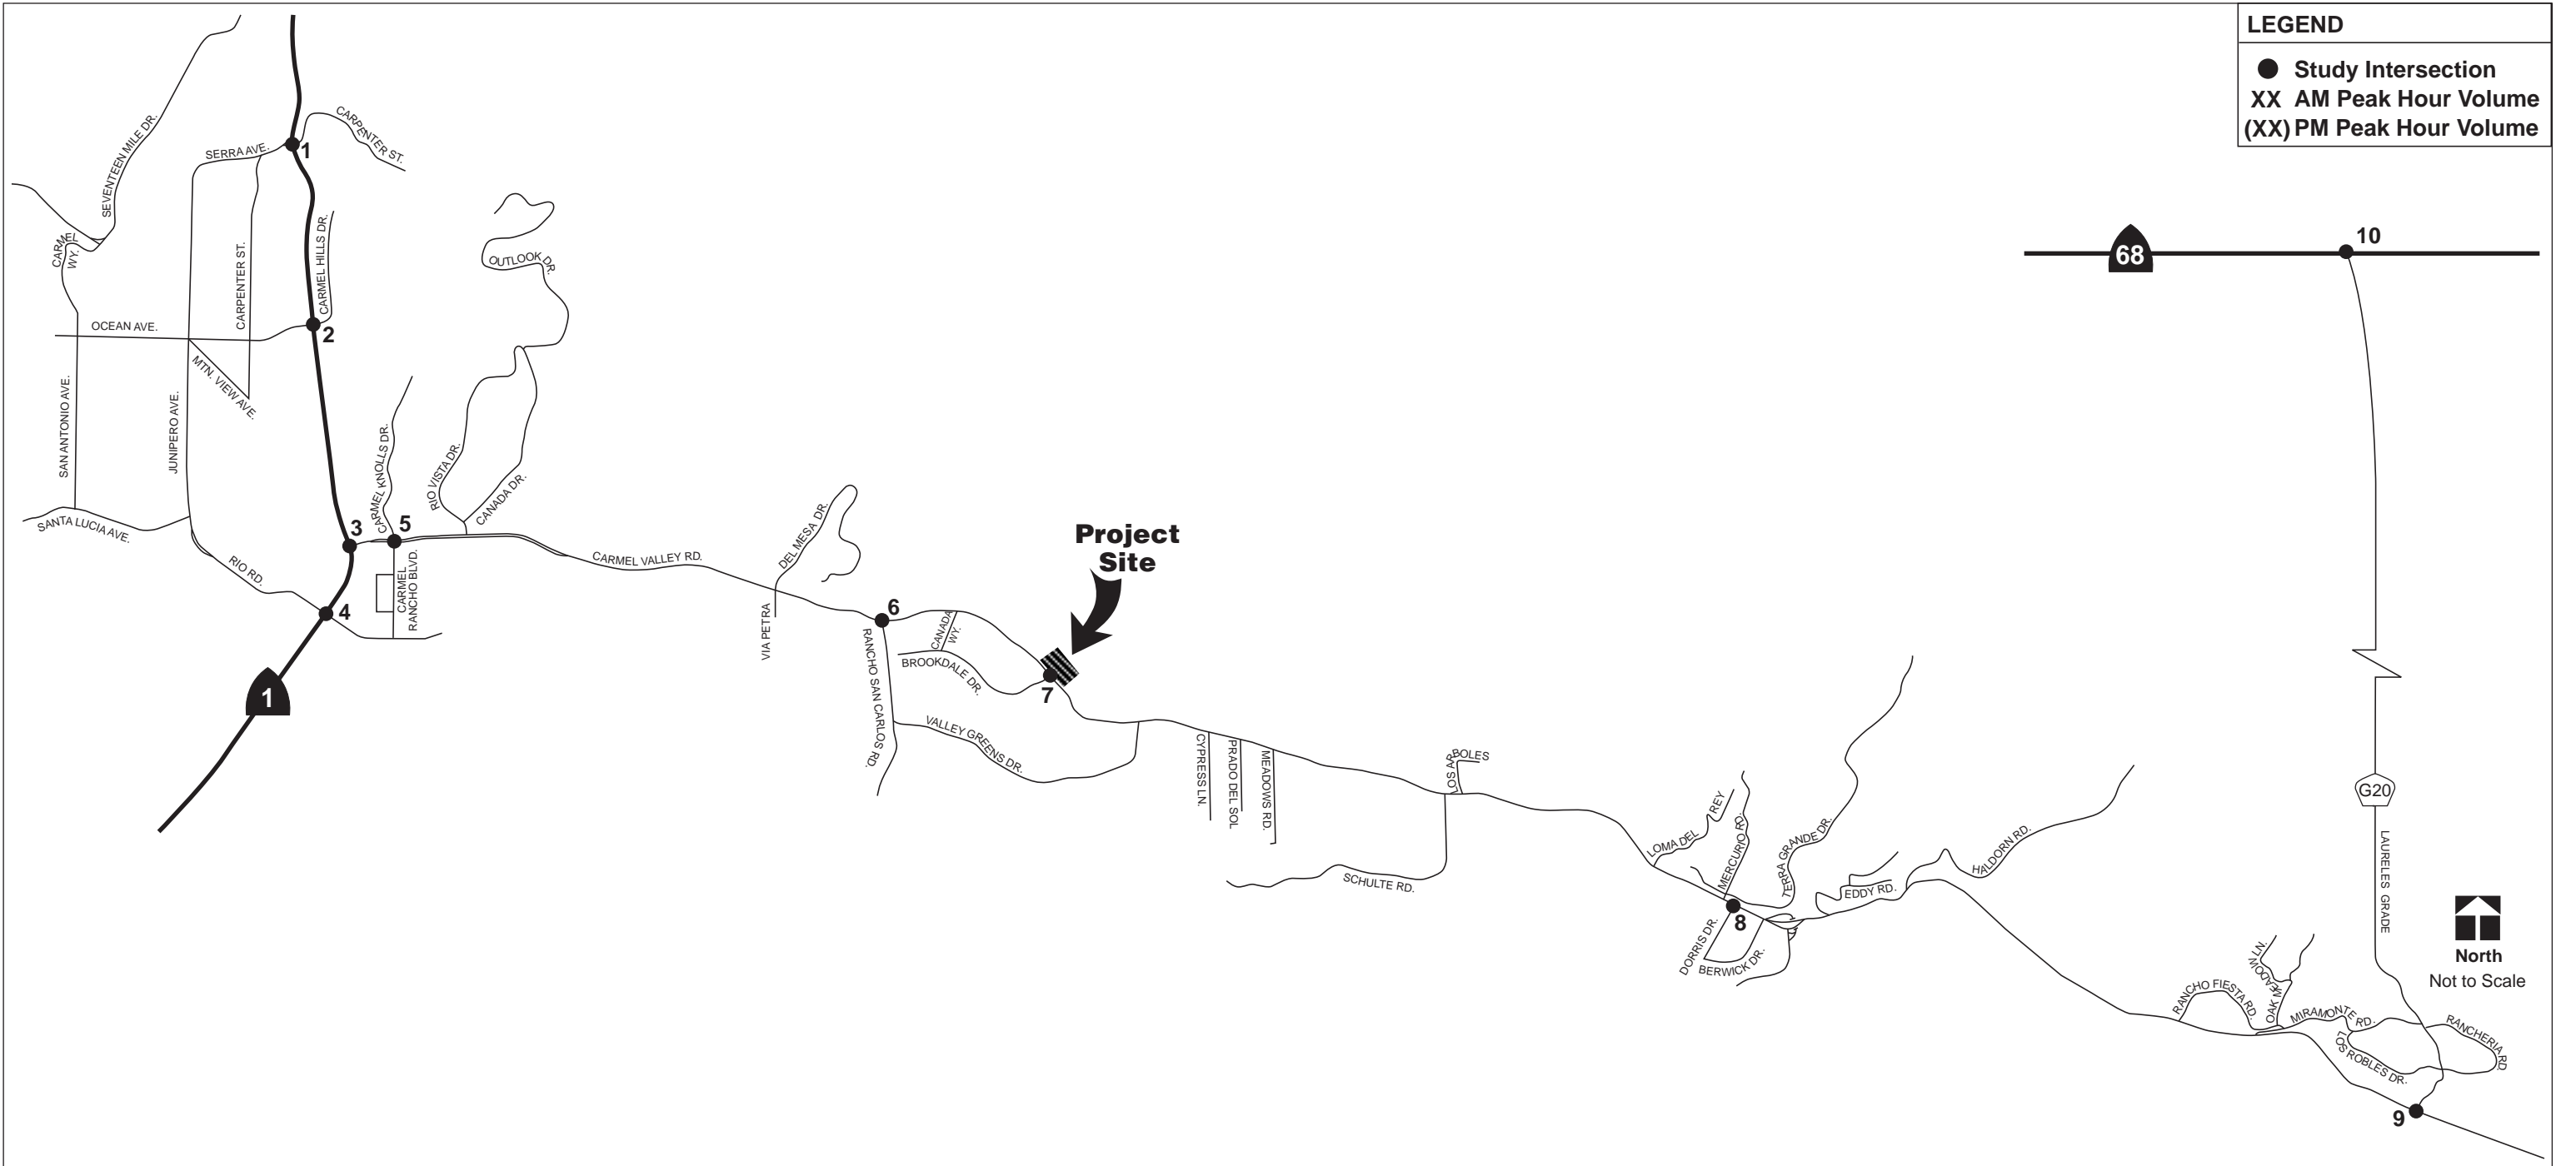

Notes:

1. Analysis is performed using the software TRAFFIX based on the 2000 Highway Capacity Manual methodologies.
2. Delay and Level of Service (LOS) are for the worst approach when the intersection is controlled by one/two way stop control (*i.e.*, intersections #7,8 and 9).
3. Delay and Level of Service (LOS) are the average for all approaches when intersection is controlled by an all-way stop or traffic signals.

Under Existing conditions, Highway 1/Carmel Valley Road (Intersection 3), Highway 1/Rio Road (Int. 4), Carmel Valley Road/Carmel Rancho Boulevard (Int. 5), Carmel Valley Road/Rancho San Carlos Road (Int. 6), and Highway 68/Laurelres Grade (Int. 10) all operate acceptably. The following five intersections operate at unacceptable service levels.

Monterey County  
September Ranch  
**Existing Turning Movement Volumes**

151-016 - 7/6/03 - PL

The intersection of Highway 1/Carpenter Street (Int. 1) currently operates at LOS D during the p.m. peak hour. The recommended mitigation for this intersection includes the utilization of the ‘overlap phasing’ to have southbound right-turns on Highway 1 go at the same time as the eastbound Carpenter Street left-turns, and the utilization of ‘overlap phasing’ to have westbound right-turns on Carpenter Street go at the same time as the southbound Highway 1 left-turns. With this mitigation, the intersection operating condition is expected to improve to an acceptable level.

The intersection of Highway 1/Ocean Avenue/Carmel Hills Drive (Int. 2) currently operates unacceptably at LOS E during the p.m. peak hour. Widening the eastbound Ocean Avenue and westbound approaches to have one exclusive left-turn lane (Exists EB & WB), one shared left-turn/through lane, and one exclusive right-turn lane is expected to improve the intersection operating condition to an acceptable level. Note that the peak traffic conditions at this intersection are related to school traffic, and therefore occur between 2:15 and 3:30 p.m.

The Brookdale approach Drive (STOP controlled) to Carmel Valley Road (Int. 7) currently operates unacceptably during both the a.m. and the p.m. peak hours. Installation of a traffic signal would mitigate the operational LOS issues at this location. However, this intersection does not meet the Caltrans’ peak hour signal warrant because of the extremely low volumes on Brookdale Drive (see Appendix G). As part of the Carmel Valley Road Improvements, the County plans to install left-turn channelization on the westbound approach at this intersection. Given the small amount of Westbound Left-turns, this improvement would do little to improve the LOS.

The Northbound Dorris Drive approach to Carmel Valley Road (Int. 8) currently operates at LOS “F” during both a.m. and the p.m. peak hours. This intersection is expected to operate acceptably with signalization. Existing traffic volumes at this intersection currently meet the Caltrans’ peak hour signal warrant.

The Southbound Laureles Grade approach to Carmel Valley Road (Int. 9) currently operates unacceptably during both a.m. and the p.m. peak hours. Installing a traffic signal would improve the operating condition to an acceptable level “B” during both peak hours. This intersection also meets the Caltrans’ peak hour signal warrant under existing traffic conditions. The signal warrant analysis is presented in Appendix G.

The County of Monterey, at the request of the Transportation Agency for Monterey County (TAMC) and Caltrans, currently collects two traffic impact fees for Highway 1 improvements. One fee is for short-term improvements, based on the number of PM peak trips using Highway 1 just north of Carmel Valley Road. The other fee is for long-term capacity improvement on Highway 1, and is based on the number of additional project-related daily trips on Highway 1.

The Carmel Valley Master Plan (CVMP) traffic impacts fees are different, and do not relate to Highway 1. The CVMP fees fund improvements on County roads, according to the adopted list of improvements.

---

## EXISTING PLUS PROPOSED PROJECT

---

This Scenario is similar to the Existing Conditions, but with the addition of traffic from the proposed September Ranch Subdivision.

### Project Trip Generation

The proposed development consists of a total of 110 new single-family (SF) detached homes. The project trip generation was estimated based on trip rates provided in *Trip Generation*, 6<sup>th</sup> Edition, published by the Institute of Transportation Engineers (ITE) in 1997. The proposed project is expected to generate approximately 1,053 daily trips, with 83 trips occurring during the a.m. peak hour and 111 trips during the p.m. peak hour. The trip generation estimates are shown in Table II.

**TABLE II: PROJECT TRIP GENERATION**

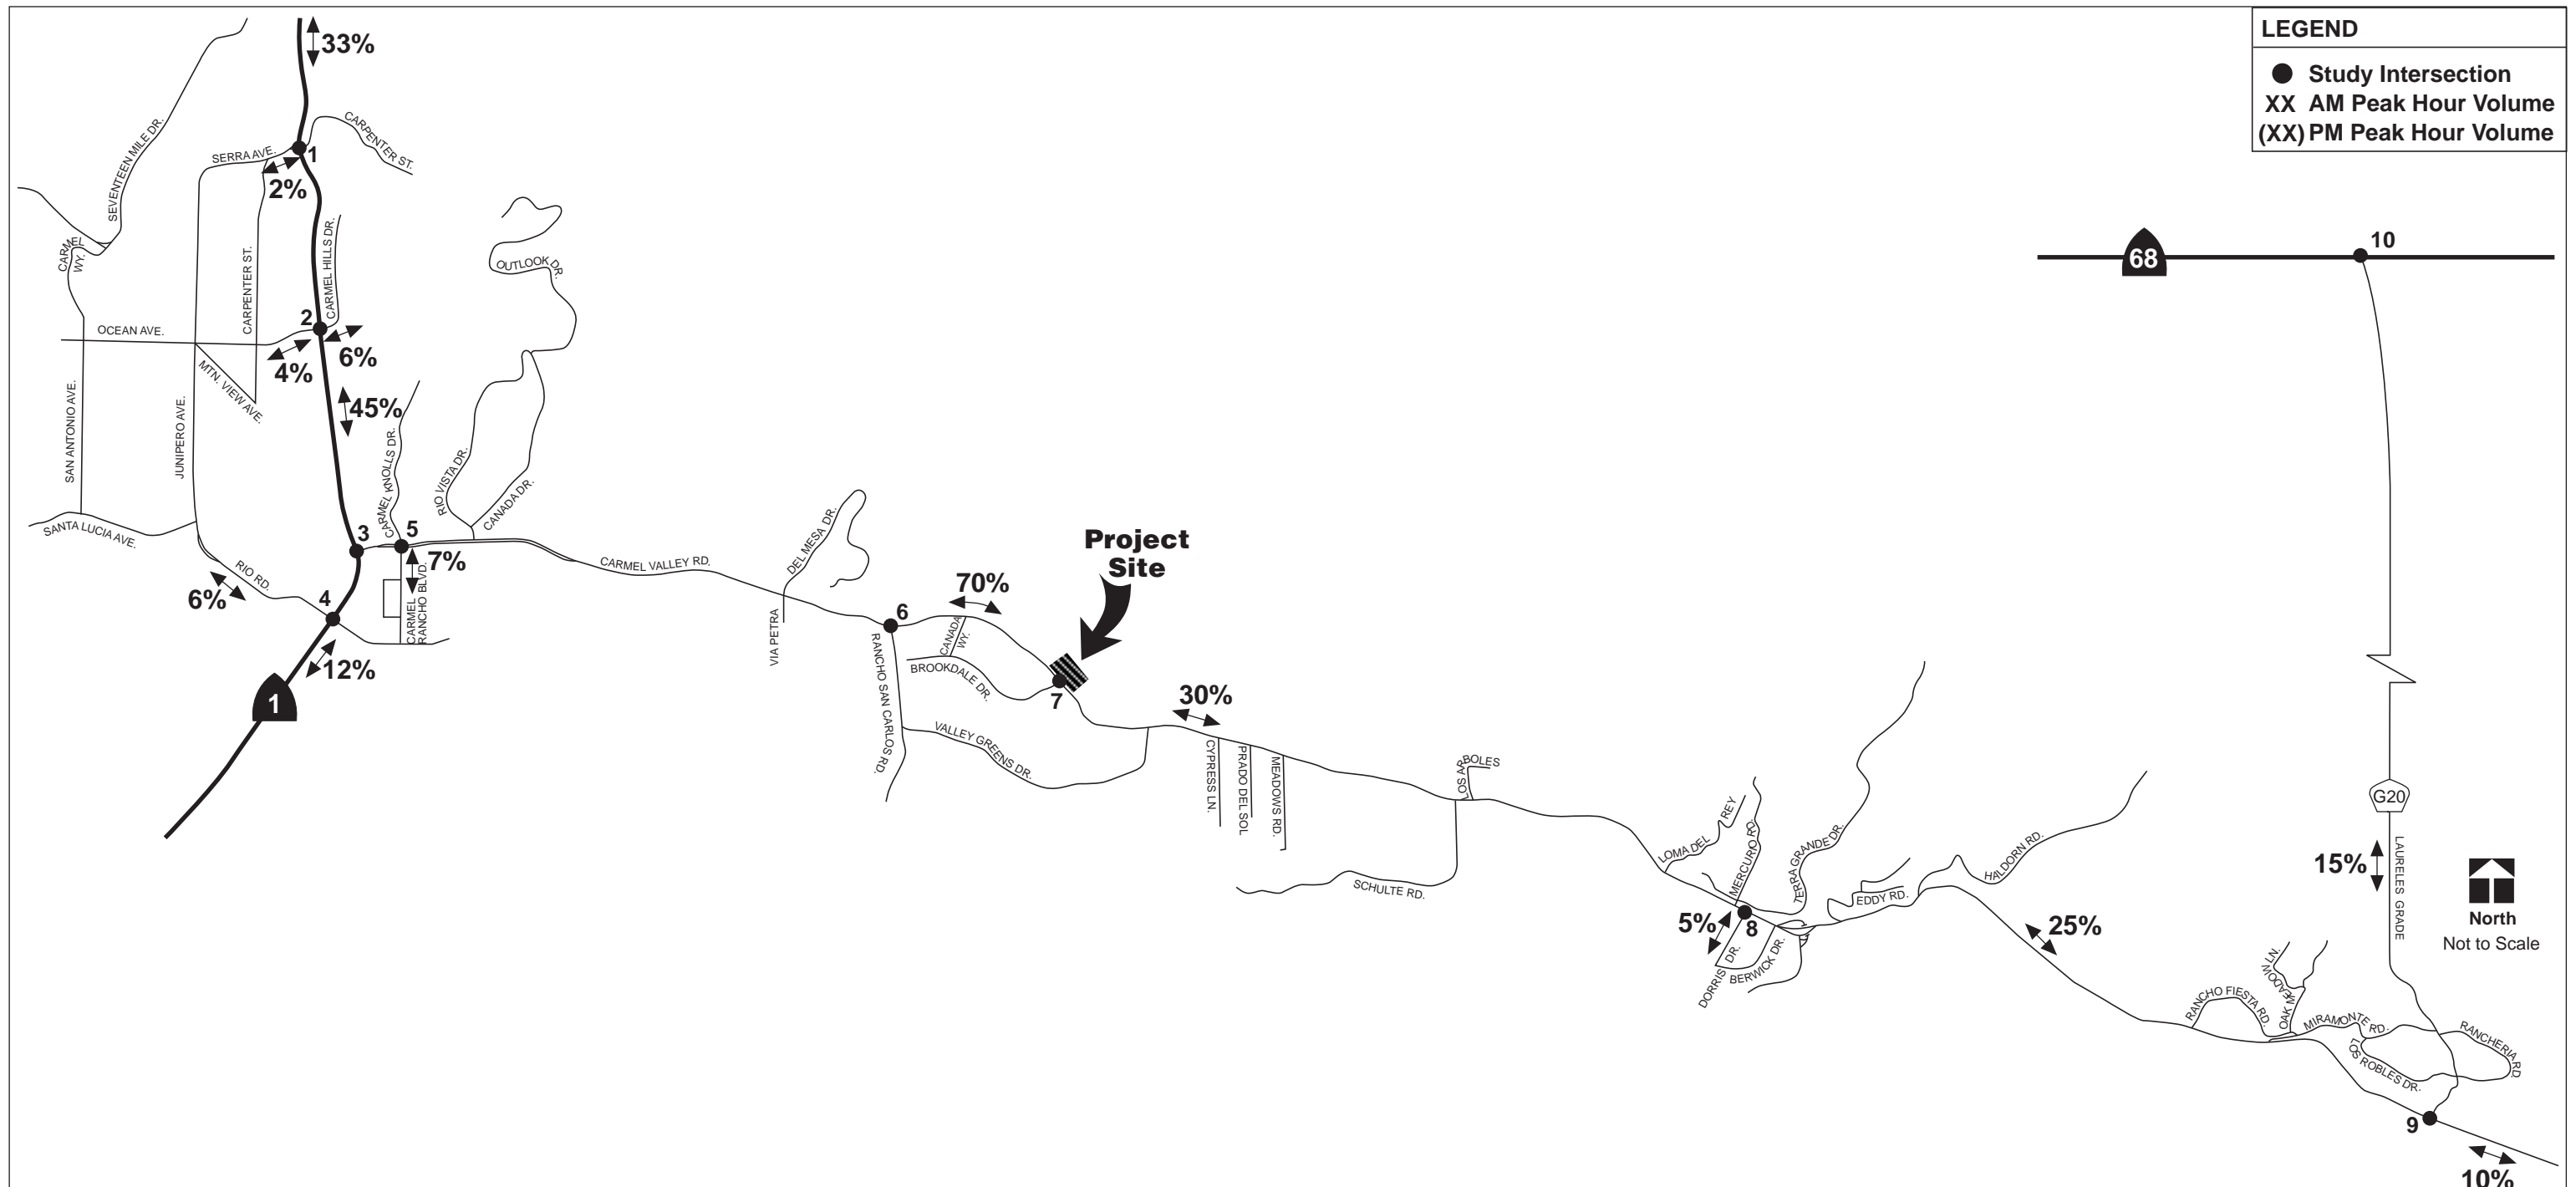

Use	Size	Daily		A.M. Peak Hour					P.M. Peak Hour				
		Rate	Trips	Rate	%In:Out	In	Out	Total	Rate	%In:Out	In	Out	Total
SF Homes	110 Units	9.57	1,053	0.75	25:75	21	62	83	1.01	64:36	71	40	111

Source: ITE *Trip Generation Manual*, 6<sup>th</sup> Edition.

### Project Trip Distribution

The trip distribution assumptions for the September Ranch Subdivision were developed based on existing travel patterns, knowledge of the study area and the input from County staff. Traffic is expected to travel to and from the site according to the distribution assumptions described below. Distribution and assignment of project-generated trips are also shown on Figure 5.

- 33% will travel to/from the north via Highway 1
- 15% will travel to/from the north via Laureles Grade
- 12% will travel to/from the south via Highway 1
- 10% will travel to/from the east via Carmel Valley Road
- 7% will travel to/from the service/commercial development on Carmel Rancho Boulevard
- 6% will travel to/from Carmel High School
- 6% will travel to/from the west via Rio Road
- 5% will travel to/from the service/commercial development on Dorris Drive
- 4% will travel to/from the west via Ocean Avenue
- 2% will travel to/from the west via Carpenter Street

### Results of Level of Service Analysis (Existing + Project)

Project traffic was added to the Existing volumes to obtain the expected turning movement volumes for the Existing plus Project scenario. See Figure 6 for the forecasted Existing plus Project peak hour turning volumes. The LOS analysis results are summarized in Table III. Detailed calculation sheets are contained in Appendix D.

Under the Existing plus Project scenario, the same five intersections as Existing conditions are expected to operate at below standard LOS. It should be noted that the operating conditions at these intersections are expected to improve to an acceptable level with the same mitigation identified under the Existing conditions.

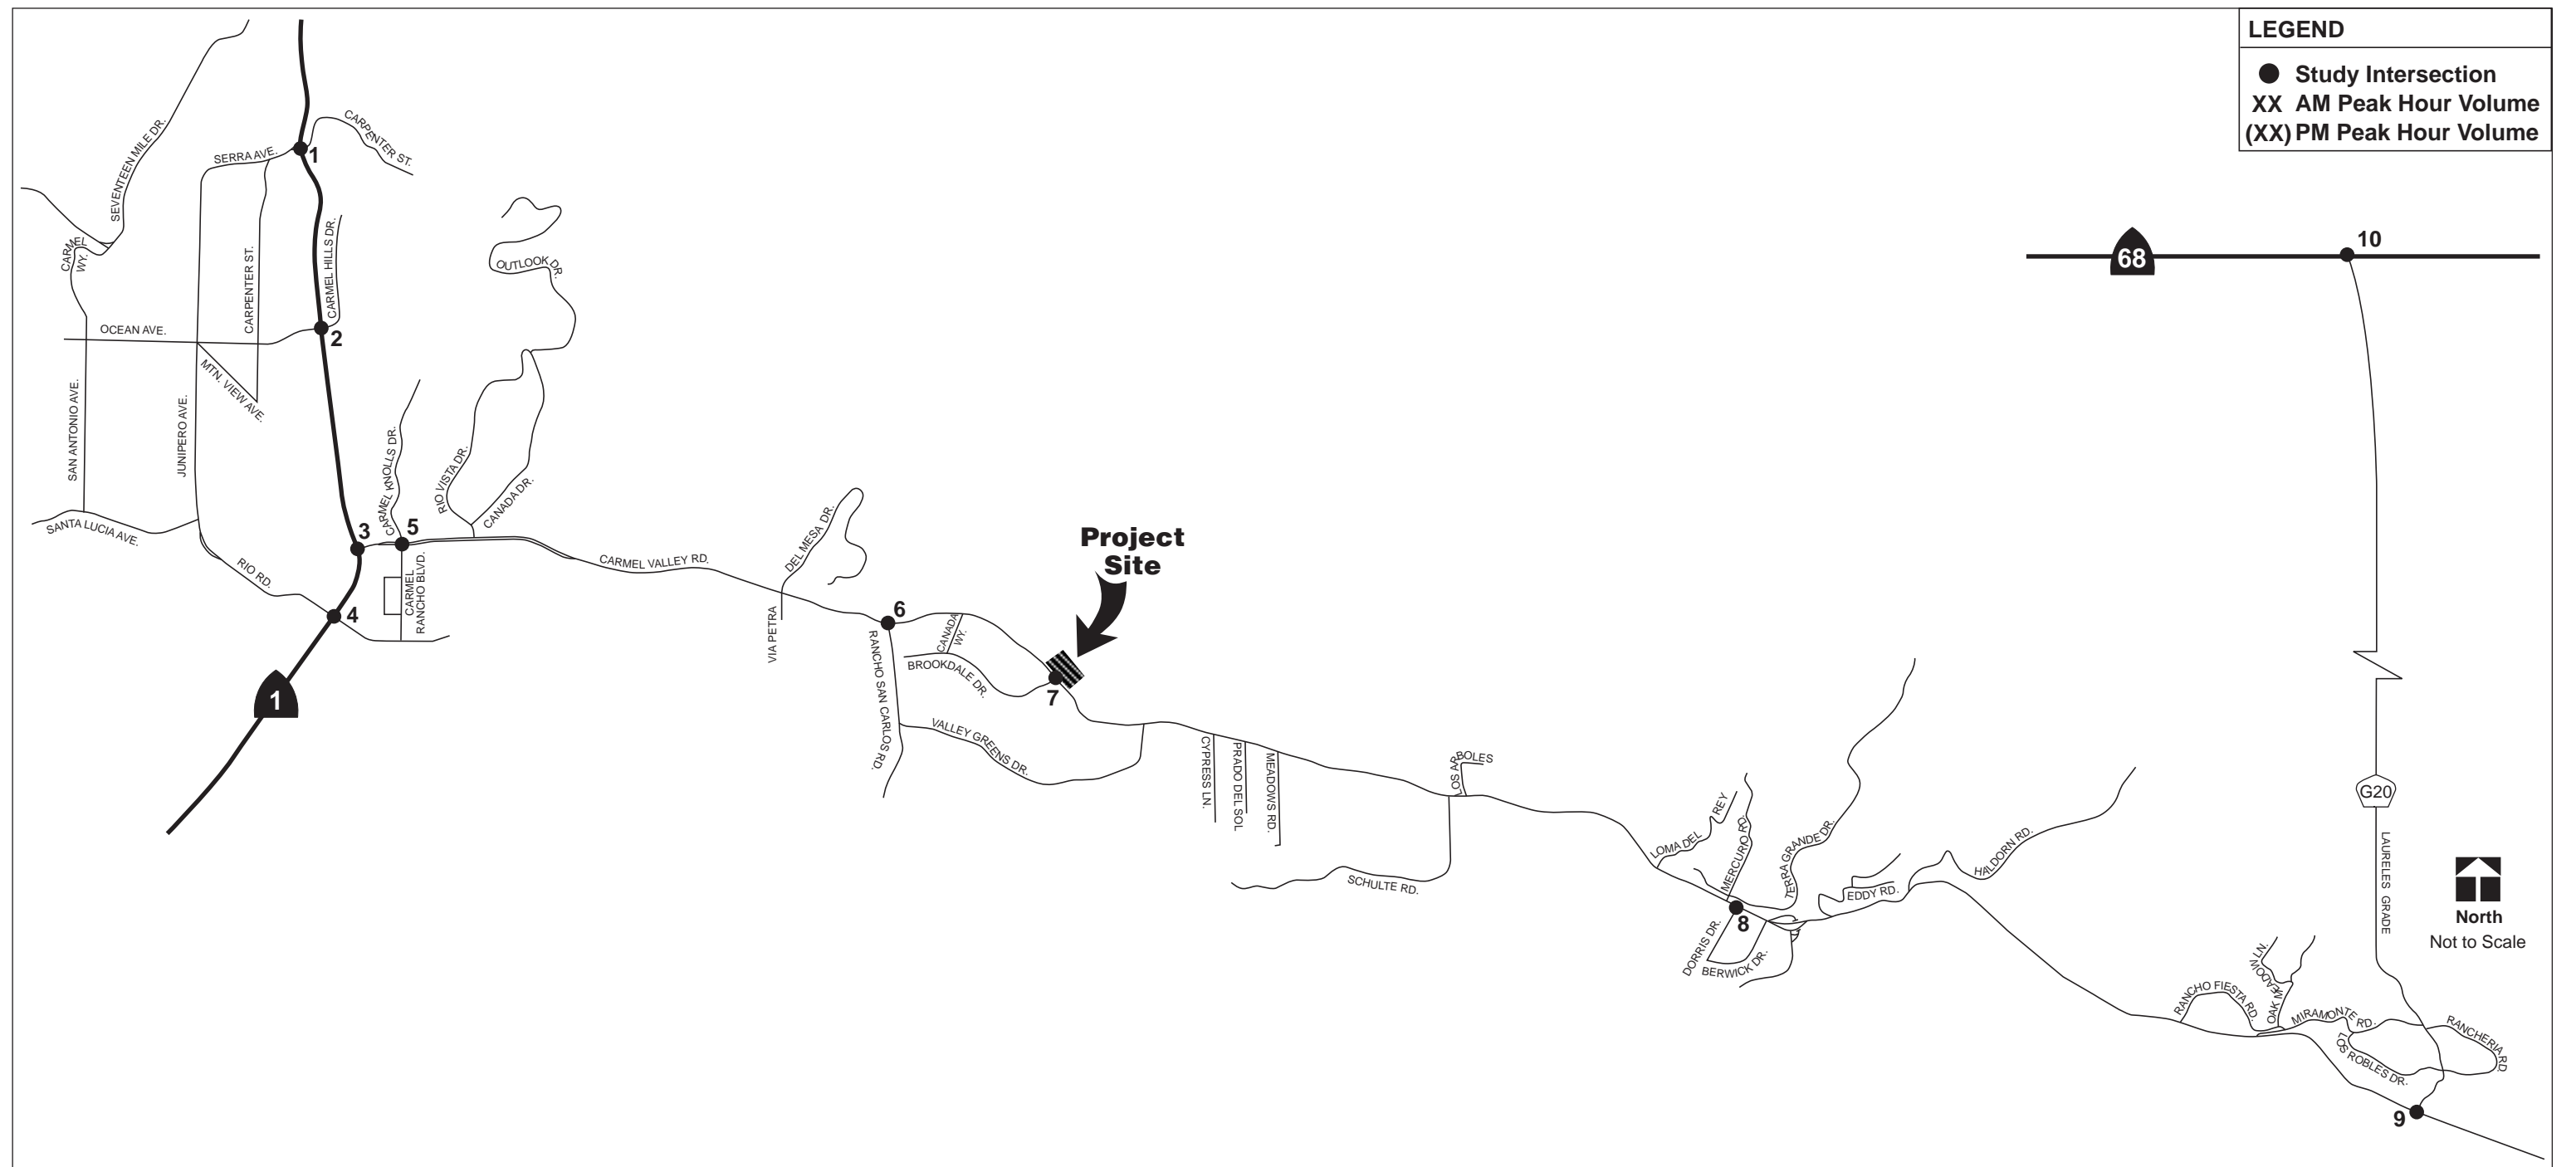

**TABLE III: EXISTING + PROJECT LEVELS OF SERVICE**

Intersection		Control	A.M. Peak		P.M. Peak	
			Delay (sec/veh)	LOS	Delay (sec/veh)	LOS
1	Highway 1/Carpenter St	Signal	23.0	C	<b>40.2</b>	<b>D</b>
	- Utilizing 'overlap' for SB and WB RT	Signal	17.0	B	34.0	C
2	Highway 1/Ocean Ave/Carmel Hills Dr	Signal	24.6	C	<b>81.9</b>	<b>F</b>
	- Widening EB and WB approaches	Signal	17.7	B	34.0	C
3	Highway 1/Carmel Valley Rd	Signal	10.5	B	26.9	C
4	Highway 1/Rio Rd	Signal	22.1	C	24.7	C
5	Carmel Valley Rd/Carmel Rancho Blvd	Signal	15.0	B	23.0	C
6	Carmel Valley Rd/Rancho San Carlos Rd	Signal	12.7	B	10.6	B
7	Carmel Valley Rd/Brookdale Dr	1-Way STOP	- <b>(120+)</b>	- <b>(F)</b>	- <b>(80.8)</b>	- <b>(F)</b>
	- Installing a traffic signal	Signal	12.7	B	12.1	B
8	Carmel Valley Rd/Dorris Dr	1-Way STOP	- <b>(103.7)</b>	- <b>(F)</b>	- <b>(74.2)</b>	- <b>(F)</b>
	- Installing a traffic signal	Signal	7.9	A	8.1	A
9	Carmel Valley Rd/Laureles Grade	1-Way STOP	- <b>(45.8)</b>	- <b>(E)</b>	- <b>(38.4)</b>	- <b>(E)</b>
	- Installing a traffic signal	Signal	11.1	B	12.7	B
10	Highway 68/Laurelres Grade	Signal	20.4	C	18.6	B

The intersection of Highway 1/Carpenter Street (Int. 1) is expected to operate unacceptably at LOS D during the p.m. peak hour. The recommended mitigation for this intersection includes the utilization of 'overlap phasing' to have westbound right-turns on Carpenter Street go at the same time as the southbound Highway 1 left-turns, and to have southbound right-turns on Highway 1 go simultaneously with the eastbound Carpenter Street left-turns (same mitigation as for Existing conditions).

**Existing + Proposed Project Turning Movement Volumes**

151-016 - 7/7/03 - PL

The intersection of Highway 1/Ocean Avenue/Carmel Hills Drive (Int. 2) is expected to continue to operate unacceptably. Widening the eastbound and westbound approaches to have one exclusive left-turn lane, one shared left-turn/through lane, and one exclusive right-turn lane (same mitigation as for Existing scenario) is expected to improve the intersection operating condition to an acceptable level. The project applicant should pay for its fair share of traffic impact fee to TAMC to help improve these two intersections (Intersection 1 and 2) along Highway 1.

The Carmel Valley Road/Brookdale Drive intersection (Int. 7) will become a four-legged intersection under Existing plus Project conditions. Its minor approaches are expected to operate unacceptably during both peak hours. With installation of a traffic signal, the intersection is expected to operate acceptably. However, the intersection is not expected to meet All-way Stop control nor signal warrants under this scenario. See Appendix G for the signal warrant analysis. As previously mentioned, the County plans to install left-turn channelization on the westbound approach at this intersection; however, the LOS analysis indicates that the intersection minor approach is still expected to operate unacceptably with left-turn channelization alone.

The minor approaches on Carmel Valley Road/Dorris Drive (Int. 8) and Carmel Valley Road/Laureles Grade (Int. 9) are expected to continue to operate unacceptably during both a.m. and the p.m. peak hours. Installing traffic signals (same mitigation as for Existing conditions) would mitigate the operational LOS issues at these locations. Both intersections are expected to meet the Caltrans's peak hour signal warrant. The project applicant should pay its fair share of CVTIF to help improve (i.e., signalize) these two intersections along Carmel Valley Road.

---

## **EXISTING+APPROVED+PENDING+PROPOSED PROJECT CONDITIONS**

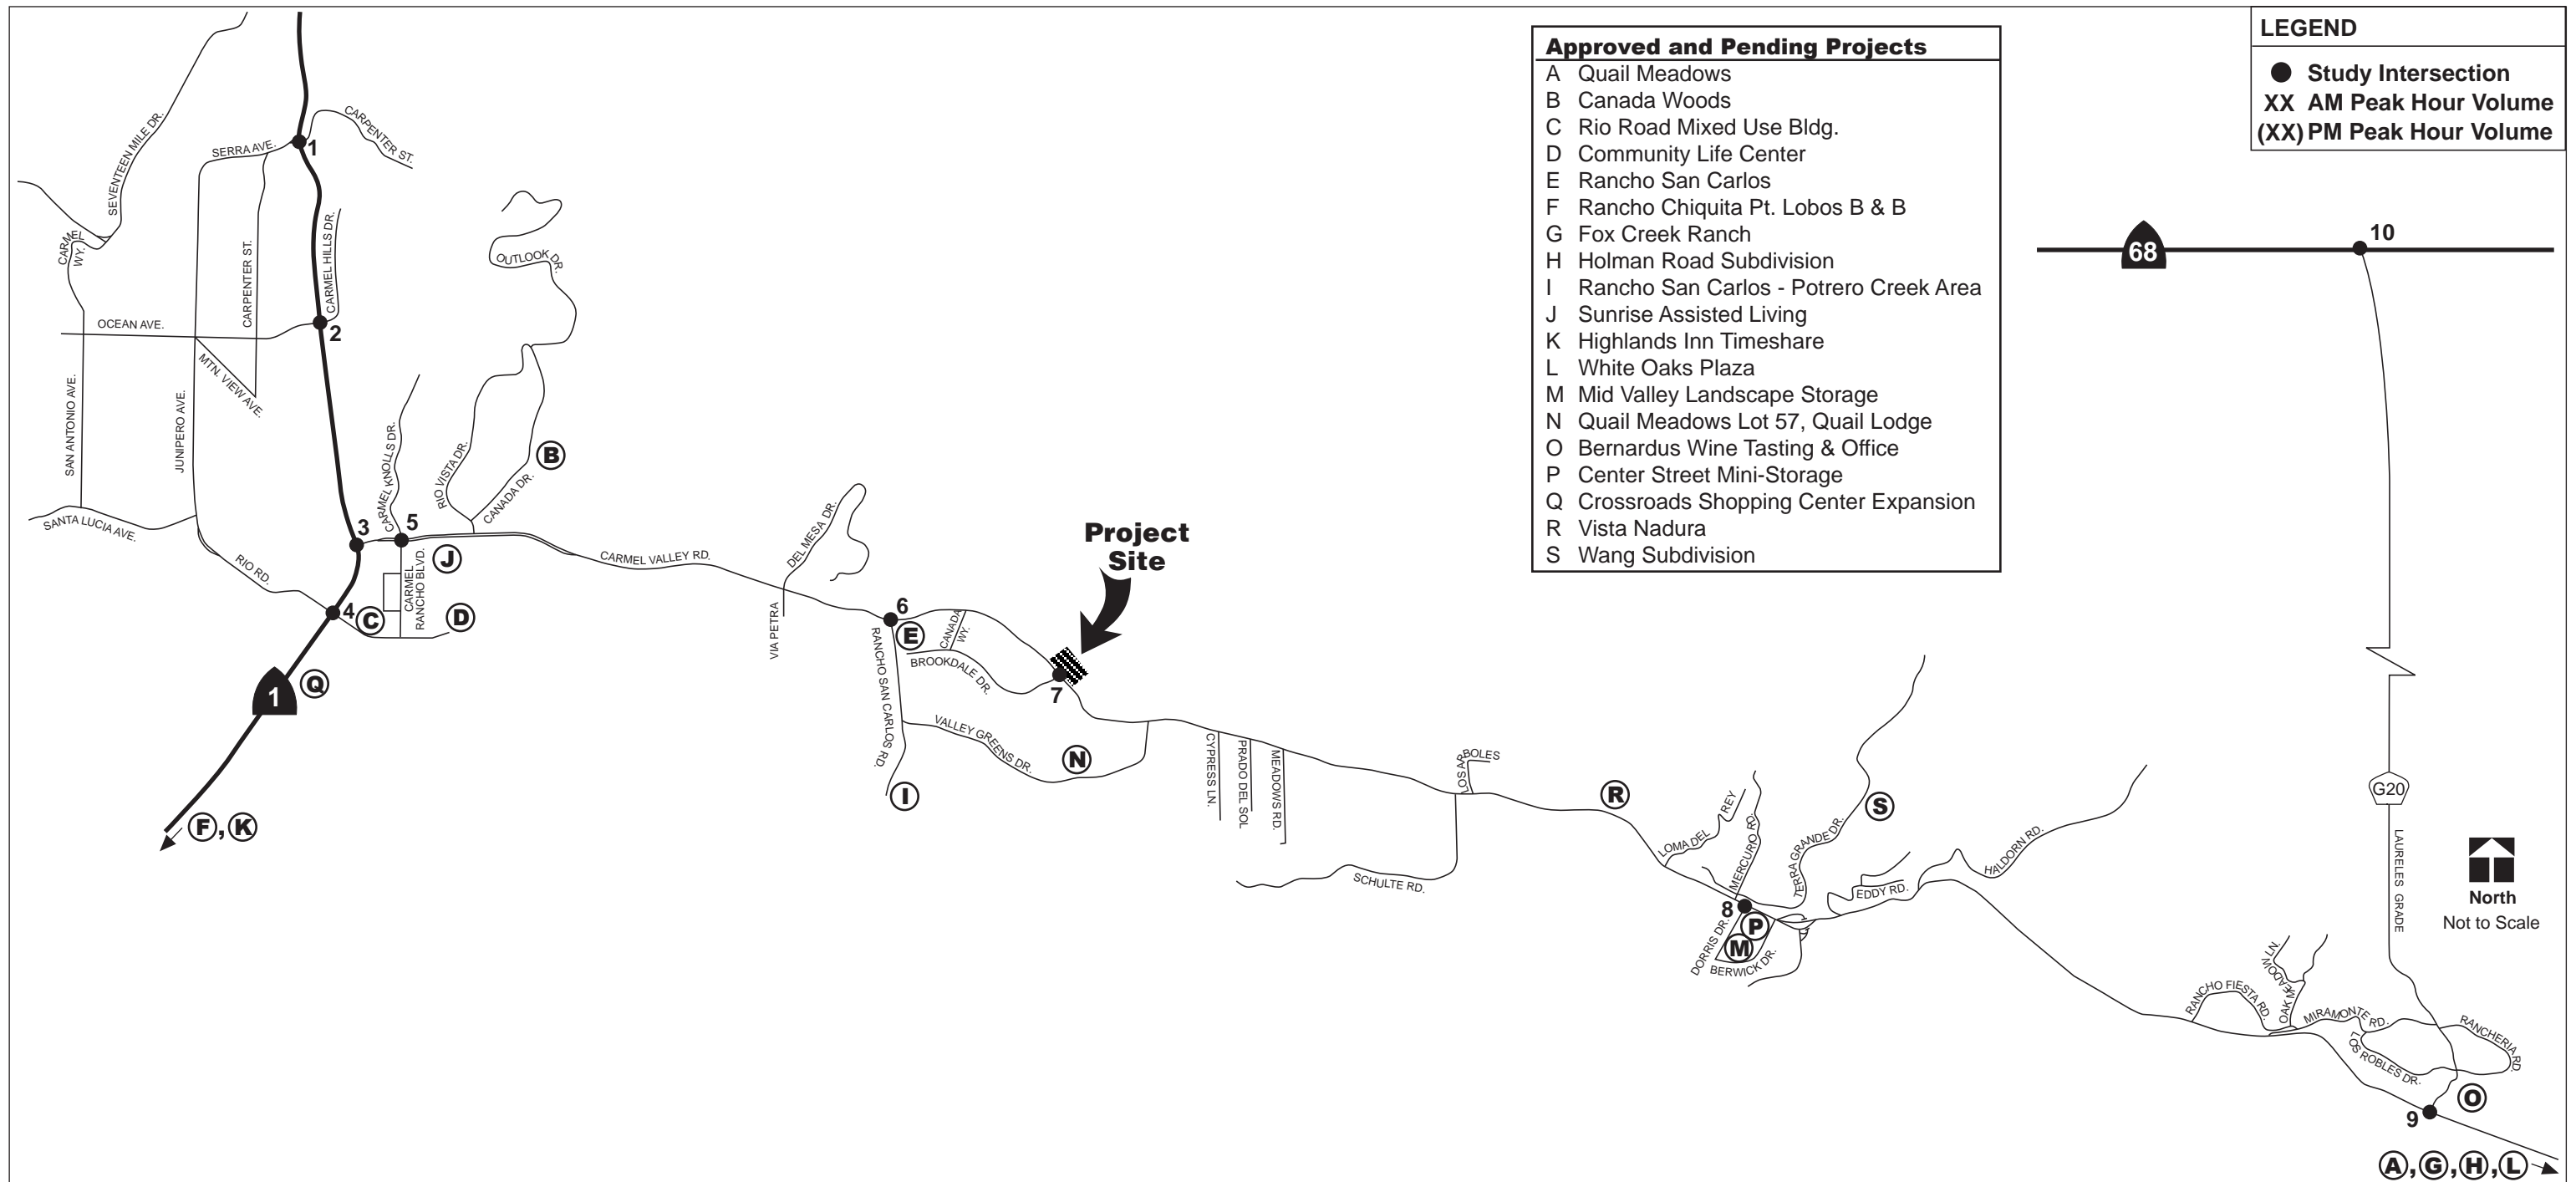

---

### **Methodology**

The peak hour turning movement volumes for this scenario were developed based on information of approved and pending/planned projects in the vicinity of the project site. Based on consultation with County staff, there are 19 approved and pending projects as listed in Table IV. The locations of these projects are shown on Figure 7.

Trip generation rates were obtained from the previous completed traffic study of corresponding projects. These projects are expected to generate a total of 8,727 daily trips, 537 a.m. peak hour trips, and 905 p.m. peak hour trips in the study area. The trip generation estimations of the projects are presented in Table IV.

The trips generated by the approved and pending projects were distributed and assigned to the street network based on existing traffic patterns, previous traffic studies and from discussions with County staff. Table V summarizes the combined trip distributions of approved and pending projects under this scenario.

Monterey County  
September Ranch  
**Existing + Project + Approved + Pending Turning Movement Volumes**

151-016 - 9/2/03 - PL

Under the Existing plus Proposed Project plus Approved plus Pending traffic conditions, four study intersections are expected to continue to operate acceptably. The following six study intersections (Same five intersections as Existing Conditions with the addition of Highway 68/Laureles Grade) are expected to operate unacceptably during the peak hours.

The intersection of Highway 1/Carpenter Street (Int. 1) is expected to continue to operate unacceptably during the p.m. peak hour. The recommended mitigation for this intersection includes 1) the utilization of the 'overlap phasing' to have westbound right-turns on Carpenter Street go at the same time as the southbound Highway 1 left-turns, 2) the utilization of 'overlap phasing' to have southbound right-turns on Highway 1 go simultaneously with the eastbound Carpenter Street left-turns, 3) modification of the westbound Carpenter Street approach convert the existing through/left-lane to only a through lane, 4) utilization of 'protected' phasing for the left-turn movement on the westbound Carpenter Street approach, and 5) utilization of 'protected+permitted' phasing for the left-turn movement on the eastbound Carpenter Street approach. With this mitigation, the intersection is expected to operate acceptably.

The intersection of Highway 1/Ocean Avenue/Carmel Hills Drive (Int. 2) is expected to continue to operate unacceptably. Widening the eastbound and westbound approaches to have one exclusive left-turn lane, one shared left-turn/through lane, and one exclusive right-turn lane, in conjunction with adding an exclusive through lane on northbound Highway 1 approach are expected to improve the intersection operating condition to an acceptable level. However, the California Coastal Act Section 30254 prohibits the widening of Highway 1 in the vicinity of the project area.

The Carmel Valley Road/Brookdale Drive intersection (Int. 7) is expected to operate unacceptably during both peak hours. With installation of a traffic signal (same mitigation as for Existing plus Project condition), the intersection is expected to operate acceptably. However, the intersection is not expected to meet the all-way STOP control nor signal warrants under this scenario. See Appendix G for the signal warrant analysis. As previously mentioned, the County has planned to install left-turn channelization on the westbound approach at this intersection; however, the LOS analysis indicates that the intersection minor approach is still expected to operate unacceptably with left-turn channelization alone.

The minor approach of Carmel Valley Road/Dorris Drive (Int. 8) and Carmel Valley Road/Laureles Grade (Int. 9) is expected to continue to operate unacceptably during both a.m. and the p.m. peak hours. Installing traffic signals (same mitigation as for Existing conditions) would mitigate the operational LOS issues at these locations. Both intersections are expected to meet the Caltran's peak hour signal warrant.

The intersection of Highway 68/Laureles Grade (Int. 10) is expected to operate unacceptably at LOS D during the p.m. peak hour. Utilizing 'overlap' phasing to have northbound right-turns on Laureles Grade go simultaneously with the westbound Highway 68 left-turns, is expected to mitigate the congestion problems at this location. However, the mitigation for Highway 68/Laureles Grade should be consistent with the operational improvements provided in the Highway 68 Action Plan for the intersection. Also, the traffic impact fee for funding the improvements in the Highway 68 Corridor was established to be \$9,750 per lot or PM peak trip (in 1995 dollars-Pasadera).

---

## CUMULATIVE CONDITIONS

---

### Methodology

This scenario evaluates traffic conditions of the build-out of the area planned by the Year 2025 in accordance with the Monterey County general plan. The cumulative a.m. and p.m. peak hour volumes were forecasted and provided by Association of Monterey Bay Governments (AMBAG) staff. Figure 9 illustrates the forecasted peak hour turning movement volumes for the cumulative Year 2025 conditions.

### Results of Level of Service Analysis (Cumulative)

Table VII summarizes the intersection LOS analysis results. The detailed calculation sheets depicting cumulative traffic operations are contained in Appendix F. Under this scenario, the intersections of Carmel Valley Road/Brookdale Drive/Project Driveway (Int. 7), Carmel Valley Road/Dorris Drive (Int. 8), and Carmel Valley Road/Laureles Grade (Int. 9) were assumed to be signalized.

Under the Cumulative Year 2025 conditions, the intersections of Carmel Valley Road/Carmel Rancho Boulevard/Carmel Knolls Drive (Int. 5) and Carmel Valley Road/Rancho San Carlos Road (Int. 6) are expected to continue to operate at acceptable levels of service. The intersections of Carmel Valley Road/Brookdale Drive/Project Driveway (Int. 7), Carmel Valley Road/Dorris Drive (Int. 8) and Carmel Valley Road/Laureles Grade (Int. 9) are also expected to operate acceptably, with signalization. The following five intersections are expected to operate unacceptably under the Year 2025 scenario.

The intersection of Highway 1/Carpenter Street (Int. 1) is expected to continue to operate unacceptably during the p.m. peak hour. The recommended mitigation for this intersection includes 1) the utilization of the 'overlap phasing' to have westbound right-turns on Carpenter Street go at the same time as the southbound Highway 1 left-turns, 2) the utilization of 'overlap phasing' to have southbound right-turns on Highway 1 go simultaneously with the eastbound Carpenter Street left-turns, 3) modification of the westbound Carpenter Street approach convert the existing through/left-lane to only a through lane, 4) utilization of 'protected' phasing for the left-turn movement on the westbound Carpenter Street approach, 5) utilization of 'protected+permitted' phasing for the left-turn movement on the eastbound Carpenter Street approach and 6) adding an additional through lane on northbound Highway 1 approach. With these measures, the intersection is expected to operate acceptably. However, the California Coastal Act Section 30254 prohibits the widening of Highway 1 in the vicinity of the project area.

The intersection of Highway 1/Ocean Avenue/Carmel Hills Drive (Int. 2) is expected to continue to operate unacceptably. The recommended mitigation for this intersection includes 1) widening the westbound approach to have one exclusive left-turn lane, one shared left-turn/through lane, and one exclusive right-turn lane, 2) widening the eastbound approach to have two exclusive left-turn lanes, one through lane, and one exclusive right-turn lane, 3) adding a third exclusive through lane on southbound Highway 1 approach, 4) utilizing 'overlap phasing' to have southbound right-turns on Highway 1 go simultaneously with the eastbound Ocean Avenue left-turns, and 5) utilizing 'overlap phasing' to have westbound right-turns on Ocean Avenue go simultaneously with the southbound Highway 1 left-turns. The intersection is expected to operate acceptably with the recommended mitigation. However, as mentioned earlier, the California Coastal Act Section 30254 prohibits the widening of Highway 1 in the vicinity of the project area.

8	Carmel Valley Rd/Dorris Dr	Signal	7.2	A	8.3	A
9	Carmel Valley Rd/Laureles Grade	Signal	13.1	B	16.0	B
10	Highway 68/Laureles Grade	Signal	27.6	C	<b>67.0</b>	<b>E</b>
	- Utilizing 'overlap' for NB RT, Modifying EB RT to a Shared TH/RT	Signal	21.1	C	18.4	B

The intersection of Highway 1/Carmel Valley Road (Int. 3) is expected to continue to operate unacceptably at LOS D during the p.m. peak hour. Modification of the northbound Highway 1 approach to have one through lane and one shared through/right-turn lane is expected to improve the intersection operating condition to an acceptable level. There current exist two lanes on the northbound receiving approach.

The intersection of Highway 1/Rio Road (Int. 4) is expected to operate unacceptably during the p.m. peak hour. The recommended mitigation includes 1) modifying the northbound Highway 1 approach to include one left-turn lane, one exclusive through lane, and one shared through/right-turn lane, 2) widening the southbound Highway 1 to have two left-turn lanes, two exclusive through lanes and one right-turn lane, and 3) utilizing 'overlap phasing' to have westbound right-turns on Rio Road go simultaneously with the southbound Highway 1 left-turns is expected to mitigate the congestion problems at this location.

The project applicant should pay its fair share to the TAMC Highway 1 Improvement Fee program for mitigation of the above four study intersections.

The intersection of Highway 68/Laureles Grade (Int. 10) is expected to operate at LOS E during the p.m. peak hour. The recommended mitigation for this location includes 1) utilizing ‘overlap’ phasing to have northbound right-turns on Laureles Grade go simultaneously with the westbound Highway 68 left-turns, and 2) modifying the eastbound Highway 68 approach to include one through lane and one shared through/right-turn lane in conjunction with adding a lane on the eastbound receiving approach. With the recommended mitigation, the intersection is expected to operate acceptably. However, the mitigation for Highway 68/Laureles Grade should be consistent with the operational improvements provided in the Highway 68 Action Plan for the intersection.

### **Recommended Lane Geometry for Carmel Valley Road/Brookdale Drive/Project Driveway**

The project access road, September Ranch Road will connect and form the fourth (north) leg at the Carmel Valley Road/Brookdale Drive intersection. The intersection is expected to operate unacceptably under Cumulative conditions with the current lane geometry and control. Signalization would improve the intersection operating conditions to acceptable levels. However, the intersection does not meet the Caltrans’ peak hour signal warrant under the Existing or any of the future scenarios analyzed. The intersection does not meet the Caltrans’ all-way STOP warrant either.

Turning warrants were analyzed to determine whether or not an exclusive right-turn lane or left-turn lane is required on Carmel Valley Road at Brookdale Road/project driveway. The detailed warrant analysis sheet are contained in Appendix H.

According to the County’s left-turn warrant analysis, a left-turn channelization is required for both eastbound and westbound Carmel Valley Road approaches under the existing conditions and all future scenarios analyzed. The right-turn warrant analysis shows that the intersection requires a taper to accommodate future westbound right-turns from Carmel Valley Road onto the project access road beginning from the existing plus project scenario. No right-turn taper is required on eastbound Carmel Valley Road.

### **Sight Distance**

September Ranch Road, the project access road, will connect with Carmel Valley Road at Brookdale Drive, forming a four-legged intersection. Carmel Valley Road is posted with a 50-mph speed limit. The standard stopping sight distance, recommended by the Caltrans Highway Design Manual (HDM), for a roadway with a design speed of 55 mph (assumed 5 mph higher than the posted speed limit) is 500 feet. Table 405.1A of the HDM recommends 630 feet for corner sight distance, based on the “7-1/2 Second Criteria”.

From the proposed location of September Ranch Road, an outbound driver would have a sight distance of approximately 375 feet looking to his right (or looking west), which does not meet the Caltrans standard for being able to see a six inch object on the Broadway. The sight distance is restricted by the small vertical curve on Carmel Valley Road. However, given that many vehicles are approximately 3 feet tall, much higher than 6 inches, drivers on Carmel Valley Road and drivers on September Ranch Road should be able to see each other from 600 feet away. A standard intersection ahead warning sign should be installed on Carmel Valley Road in advance of September Ranch to alert drivers on Eastbound Carmel Valley Road. Installing a traffic signal would be another option to mitigate sight distance problem. The sight distance looking to the left (or looking east) is approximately 760 feet, which exceeds the required limit for stopping and corner sight distance.

---

## ROADWAY SEGMENT ANALYSIS

---

Roadway segment analysis was conducted to determine the number of through lanes that may be needed to have Carmel Valley Road operate at acceptable levels of service for all study scenarios. The analysis focused on the p.m. peak traffic conditions on the following four segments of Carmel Valley Road:

- 1) Robinson Canyon Road – Schulte Road
- 2) Schulte Road – Rancho San Carlos Road
- 3) Rancho San Carlos Road – Carmel Rancho Boulevard
- 4) Carmel Rancho Boulevard – Highway 1

Monterey County staff provided the existing (Year 2002) average daily traffic on these four segments. The analysis assumed that the p.m. peak hour volumes were approximately 10 percent of the daily traffic volumes. Forecasted Year 2025 p.m. peak volumes were derived from the information contained in the AMBAG model. The existing and forecasted p.m. volumes on for both directions the study segments are summarized below:

1. Carmel Valley Road, Robinson Canyon Road – Schulte Road,  
Existing p.m. volumes - 1,460 vph  
Existing plus Project p.m. volumes - 1,538 vph  
Existing plus Project plus Approved plus Pending p.m. volumes - 1,828 vph  
Cumulative Year 2025 p.m. volumes - 1,990 vph
  
2. Carmel Valley Road, Schulte Road – Rancho San Carlos Road,  
Existing p.m. volumes - 1,630 vph  
Existing plus Project p.m. volumes - 1,708 vph  
Existing plus Project plus Approved plus Pending p.m. volumes - 1,998 vph  
Cumulative Year 2025 ADT- 2,170 vph
  
3. Carmel Valley Road, Rancho San Carlos Road – Carmel Rancho Boulevard,  
Existing p.m. volumes - 2,430 vph  
Existing plus Project p.m. volumes - 2,508 vph  
Existing plus Project plus Approved plus Pending p.m. volumes - 2,926 vph  
Cumulative Year 2025 p.m. volumes - 3,190 vph
  
4. Carmel Valley Road, Carmel Rancho Boulevard – Highway 1,  
Existing p.m. volumes - 2,410 vph  
Existing plus Project p.m. volumes - 2,469 vph  
Existing plus Project plus Approved plus Pending p.m. volumes - 2,814 vph  
Cumulative Year 2025 p.m. volumes - 3,080 vph

Carmel Valley Road is a two-lane rural highway. The information about the LOS methodology for a two-lane highway (one-lane in each direction) segments can be found in the Transportation Research Board's 2000 *Highway Capacity Manual* (HCM). The HCM suggested a capacity of 3,400 vehicles per hour for both directions combined.

As shown, the existing and forecasted volumes on the four study segments are expected to be within the two-lane highway capacity. Therefore, Carmel Valley Road should be able to accommodate future traffic in the area. However, the Carmel Valley Master Plan (as of 1995) lists three long-term passing lane improvements along Carmel Valley Road at the following locations:

- In front of September Ranch
- Opposite of Garland Ranch Regional Park, which is east of Robinson Canyon Road
- Near Laureles Grade Road, which is east of Garland Ranch Regional Park

---

## SUMMARY OF MITIGATION

---

### *Existing Conditions*

The following improvements are required for existing conditions:

1. Utilizing 'overlap phasing' for westbound right-turns and southbound right-turns at the intersection of Highway 1/Carpenter Street (Int. 1).
2. Widening the eastbound and westbound approaches of the Highway 1/Ocean Avenue/Carmel Hills Drive (Int. 2) to have one exclusive left-turn lane, one shared left-turn/through lane, and one exclusive right-turn lane on each approach;
3. Signalizing the Carmel Valley Road/Dorris Drive intersection (Int. 8);
4. Signalizing the Carmel Valley Road/Laureles Grade intersection (Int. 9).

### *Proposed September Ranch Mitigation Measures*

1. The project will be responsible for contributing towards planned long-term improvements to Highway 1. The contribution will be calculated based on the expected daily project trips on Highway 1 north of Carmel Valley Road. This contribution will be the projects fair share to improve the intersections along Highway 1, including Highway 1/Carpenter Street (Int. 1), Highway 1/Ocean Avenue/Carmel Hills Drive (Int. 2), Highway 1/Carmel Valley Road (Int. 3), and Highway 1/Rio Road (Int. 4).
2. The project will be responsible for installing the fourth (north) leg of September Ranch Road (the project access road) at the existing stop controlled T-intersection of Carmel Valley Road/Brookdale Drive (Int. 7). The project will also be responsible for signalizing this intersection and any signal coordination costs associated with this signalization.
3. Lane improvement at Carmel Valley Road/Brookdale Drive/September Ranch Road; installing a right-turn taper on westbound Carmel Valley Road, and installing a left-turn lane for both the eastbound and westbound Carmel Valley Road approaches.
4. Installing an intersection ahead warning sign on eastbound Carmel Valley Road in advance of September Ranch Road to alert drivers on Carmel Valley Road.
5. The County will determine the project's Carmel Valley Traffic Impact Fee (CVTIF). The funding may be used to improve Carmel Valley Road/Dorris Drive (Int. 8) and Carmel Valley Road/Laureles Grade (Int. 9).
6. The project will be responsible for its fair share contribution towards the cost of installing a traffic signal at the Rio Road/Carmel Rancho Boulevard intersection<sup>1</sup>. The fee will be calculated based on the amount of the project p.m. trips that are expected to use the intersection.
7. The project should provide a fair share contribution towards cumulative impact mitigations as described in the following Cumulative Mitigation Measures section.

---

<sup>1</sup> This intersection is not part of the present traffic study; however, the County staff identified signalization as a mitigation measures for this location.

*Cumulative (Year 2025) Mitigation Measures*

1. Signal modification and widening of the Highway 68/Laureles Grade intersection; to utilize 'overlap phasing' to have northbound right-turns on Laureles Grade go simultaneously with the westbound Highway 68 left-turns, and to modify the eastbound Highway 68 approach to include one through lane and one shared through/right-turn lane. However, the mitigation for Highway 68/Laureles Grade should be consistent with the operational improvements provided in the Highway 68 Action Plan for the intersection.

**APPENDIX A – LEVEL OF SERVICE METHODOLOGY**

---

## I. INTRODUCTION

### SCOPE OF THE METHODOLOGY

This chapter contains a methodology for analyzing the capacity and level of service (LOS) of signalized intersections. The analysis must consider a wide variety of prevailing conditions, including the amount and distribution of traffic movements, traffic composition, geometric characteristics, and details of intersection signalization. The methodology focuses on the determination of LOS for known or projected conditions.

The methodology addresses the capacity, LOS, and other performance measures for lane groups and intersection approaches and the LOS for the intersection as a whole. Capacity is evaluated in terms of the ratio of demand flow rate to capacity ( $v/c$  ratio), whereas LOS is evaluated on the basis of control delay per vehicle (in seconds per vehicle). Control delay is the portion of the total delay attributed to traffic signal operation for signalized intersections. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. Appendix A presents a method for observing intersection control delay in the field. Exhibit 10-9 provides definitions of the basic terms used in this chapter.

Each lane group is analyzed separately. Equations in this chapter use the subscript  $i$  to indicate each lane group. The capacity of the intersection as a whole is not addressed because both the design and the signalization of intersections focus on the accommodation of traffic movement on approaches to the intersection.

The capacity analysis methodology for signalized intersections is based on known or projected signalization plans. Two procedures are available to assist the analyst in establishing signalization plans. The first is the quick estimation method, which produces estimates of the cycle length and green times that can be considered to constitute a reasonable and effective signal timing plan. The quick estimation method requires minimal field data and relies instead on default values for the required traffic and control parameters. It is described and documented in Chapter 10.

A more detailed procedure is provided in Appendix B of this chapter for estimating the timing plan at both pretimed and traffic-actuated signals. The procedure for pretimed signals provides the basis for the design of signal timing plans that equalize the degree of saturation on the critical approaches for each phase of the signal sequence. This procedure does not, however, provide for optimal operation.

The methodology in this chapter is based in part on the results of a National Cooperative Highway Research Program (NCHRP) study (1, 2). Critical movement capacity analysis techniques have been developed in the United States (3-5), Australia (6), Great Britain (7), and Sweden (8). Background for delay estimation procedures was developed in Great Britain (7), Australia (9, 10), and the United States (11). Updates to the original methodology were developed subsequently (12-24).

### LIMITATIONS TO THE METHODOLOGY

The methodology does not take into account the potential impact of downstream congestion on intersection operation. Nor does the methodology detect and adjust for the impacts of turn-pocket overflows on through traffic and intersection operation.

## II. METHODOLOGY

Exhibit 16-1 shows the input and the basic computation order for the method. The primary output of the method is level of service (LOS). This methodology covers a wide range of operational configurations, including combinations of phase plans, lane

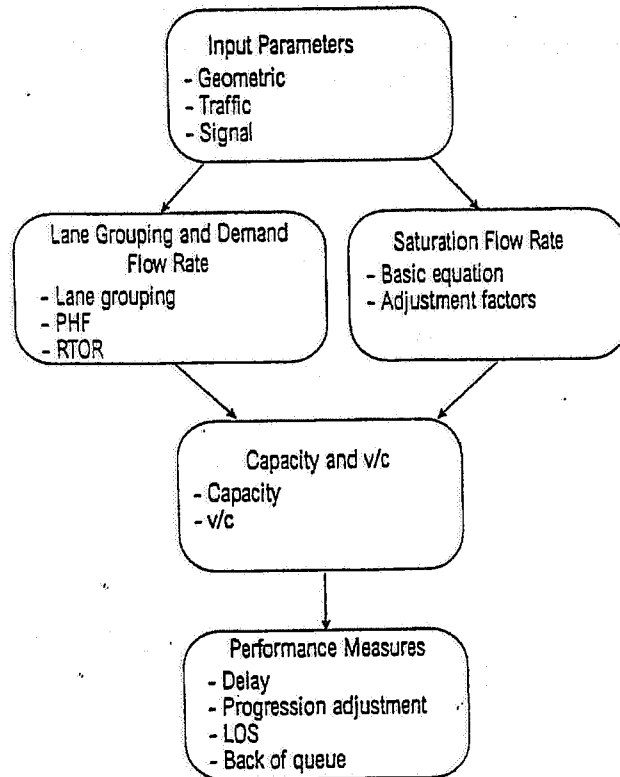

*Background and underlying concepts for this chapter are in Chapter 10*

*A lane group is indicated in formulas by the subscript  $i$*

*See Chapter 10 for description of quick estimation method*

utilization, and left-turn treatment alternatives. It is important to note that some of these configurations may be considered unacceptable by some operating agencies from a traffic safety point of view. The safety aspect of signalized intersections cannot be ignored, and the provision in this chapter of a capacity and LOS analysis methodology for a specific operational configuration does not imply an endorsement of the suitability for application of such a configuration.

EXHIBIT 16-1. SIGNALIZED INTERSECTION METHODOLOGY

**LOS**

The average control delay per vehicle is estimated for each lane group and aggregated for each approach and for the intersection as a whole. LOS is directly related to the control delay value. The criteria are listed in Exhibit 16-2.

EXHIBIT 16-2. LOS CRITERIA FOR SIGNALIZED INTERSECTIONS

LOS criteria

LOS	Control Delay per Vehicle (s/veh)
A	≤ 10
B	> 10–20
C	> 20–35
D	> 35–55
E	> 55–80
F	> 80

## **PART A. TWO-WAY STOP-CONTROLLED INTERSECTIONS**

### **I. INTRODUCTION - PART A**

In this section a methodology for analyzing capacity and level of service of two-way stop-controlled (TWSC) intersections is presented.

### **II. METHODOLOGY - PART A**

Capacity analysis at TWSC intersections depends on a clear description and understanding of the interaction of drivers on the minor or stop-controlled approach with drivers on the major street. Both gap acceptance and empirical models have been developed to describe this interaction. Procedures described in this chapter rely on a gap acceptance model developed and refined in Germany (1). The concepts from this model are described in Chapter 10. Exhibit 17-1 illustrates input to and the basic computation order of the method described in this chapter.

#### **LEVEL-OF-SERVICE CRITERIA**

Level of service (LOS) for a TWSC intersection is determined by the computed or measured control delay and is defined for each minor movement. LOS is not defined for the intersection as a whole. LOS criteria are given in Exhibit 17-2.

*Both theoretical and empirical approaches have been used to arrive at a methodology*

*LOS is not defined for the overall intersection*

---

*Highway Capacity Manual 2000*

The LOS criteria for TWSC intersections are somewhat different from the criteria used in Chapter 16 for signalized intersections primarily because different transportation facilities create different driver perceptions. The expectation is that a signalized intersection is designed to carry higher traffic volumes and experience greater delay than an unsignalized intersection.

*LOS thresholds differ from those for signalized intersections to reflect different driver expectations*

EXHIBIT 17-1. TWSC UNSIGNALIZED INTERSECTION METHODOLOGY

Level Of Service Computation Report

2000 HCM Unsignalized Method (Future Volume Alternative)

Intersection #8 Carmel Valley Road/Dorris Drive

Average Delay (sec/veh): 22.5 Worst Case Level Of Service: F

Table with 4 columns: North Bound, South Bound, East Bound, West Bound. Rows include Movement (L-T-R), Control (Stop Sign, Uncontrolled), Rights (Include), and Lanes (1-0-0-0-1).

Volume Module: >> Count Date: 18 Dec 2002 << 7:15-8:15 AM Peak Hour. Rows include Base Vol, Growth Adj, Initial Bse, Added Vol, PasserByVol, Initial Fut, User Adj, PHF Adj, PHF Volume, Reduct Vol, Final Vol.

Critical Gap Module: Critical Gp, FollowUpTim. Values include 6.4, 6.2, 3.5, 3.3 and various 'xxxx' placeholders.

Capacity Module: Cnflct Vol, Potent Cap., Move Cap. Values include 1632, 113, 106 and various 'xxxx' placeholders.

Level Of Service Module: Stopped Del, LOS by Move, Movement, Shared Cap., Shrd StpDel, Shared LOS, ApproachDel, ApproachLOS. Values include 293.8, 13.5, 232.6 and various 'xxxx' placeholders.

Level Of Service Computation Report
2000 HCM Operations Method (Future Volume Alternative)

Intersection #9 Carmel Valley Road/Laureles Grade

Cycle (sec): 60 Critical Vol./Cap. (X): 0.564
Loss Time (sec): 9 (Y+R = 4 sec) Average Delay (sec/veh): 16.0
Optimal Cycle: OPTIMIZED Level Of Service: B

Table with 4 columns: North Bound, South Bound, East Bound, West Bound. Rows include Movement, Control, Rights, Min. Green, and Lanes.

Volume Module table with 12 columns representing different traffic movements and 12 rows of volume-related metrics.

Saturation Flow Module table with 12 columns and 4 rows showing saturation flow rates and adjustments.

Capacity Analysis Module table with 12 columns and 12 rows showing capacity analysis metrics like Vol/Sat, Crit Moves, Green/Cycle, etc.

Level Of Service Computation Report
2000 HCM Operations Method (Future Volume Alternative)

\*\*\*\*\*
Intersection #10 Highway 68/Laureles Grade
\*\*\*\*\*

Cycle (sec): 75 Critical Vol./Cap. (X): 0.926
Loss Time (sec): 9 (Y+R = 4 sec) Average Delay (sec/veh): 27.6
Optimal Cycle:OPTIMIZED Level Of Service: C

Table with 4 columns: North Bound, South Bound, East Bound, West Bound. Rows include Approach, Movement, Control, Rights, Min. Green, and Lanes.

Volume Module: Table with 13 columns for different volume types (Base Vol, Growth Adj, etc.) and 4 columns for North, South, East, West bounds.

Saturation Flow Module: Table with 13 columns for saturation flow types (Sat/Lane, Adjustment, etc.) and 4 columns for North, South, East, West bounds.

Capacity Analysis Module: Table with 13 columns for capacity analysis types (Vol/Sat, Crit Moves, etc.) and 4 columns for North, South, East, West bounds.

**APPENDIX G – SIGNAL WARRANT ANALYSIS**

---

Figure 9-9  
**PEAK HOUR VOLUME WARRANT**  
 (Rural Areas)

Intersection #7 - Carmel Valley Road/Brookdale Drive

**\* NOTE:**

100 VPH /  
 APPROACH  
 THRESHC

- A - EXISTING - AM PEAK
- B - EXISTING - PM PEAK
- C - EXISTING + PROJECT - AM
- D - EXISTING + PROJECT - PM
- E - CUMULATIVE - AM
- F - CUMULATIVE - PM

FOR A MINOR STREET  
 APPLIES AS THE LOWER  
 ING WITH ONE LANE.

Figure 9-9  
**PEAK HOUR VOLUME WARRANT**  
 (Rural Areas)

*Intersection #8 - Carmel Valley Road/Dorris Drive*

**\* NOTE:**

100 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACH WITH TWO OR MORE LANES AND 75 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACHING WITH ONE LANE.

Figure 9-9  
PEAK HOUR VOLUME WARRANT  
(Rural Areas)

Intersection #9 - Carmel Valley Road / Laureles Grade

\* NOTE:  
100 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACH WITH TWO OR MORE LANES AND 75 VPH APPLIES AS THE LOWER THRESHOLD VOLUME FOR A MINOR STREET APPROACHING WITH ONE LANE.

 WESTBOUND  
 EXIST + PROJECT - AM  
 CUMULATIVE - AM

## LEFT TURN CHANNELIZATION

## REQUIRED

LEFT TURN  
 CHANNELIZATION  
 NOT REQUIRED

20 YR. PROJECTED AADT (Mainline Volume)

Intersection #7 - Carmel Valley Road/Brookdale Drive  
Eastbound Approach

### RIGHT-TURN WARRANTS , 2-LANE HIGHWAY

Scenario	Total	Right-Turning	Warrant Met?
A Existing - AM	634	3	No
B Existing - PM	1157	7	No
C Ex+Project AM	649	3	No
D Ex+Project PM	1207	7	No
E Cumulative AM	744	3	No
F Cumulative PM	1340	7	No

Source: Transportation Research Board,  
"Intersection Channelization Guide",  
NCHRP Report 287, November, 1985, p. 64.

Note: For posted speeds at or under 45 mph, peak hour right turns greater than 40 vph, and total peak hour approach less than 300 vph, adjust right turn volumes.

Adjust peak hour right turns = peak hour right turns - 20.

Intersection #7 - Carmel Valley Road/Brookdale Drive  
Westbound Approach

### RIGHT-TURN WARRANTS , 2-LANE HIGHWAY
