RE: Rio Ranch Retail Development 100-Year Floodplain Effects, County of Monterey

Dear Mr. Wiele:

Thank you for extending our firm the opportunity to assist Foothill Partners Inc. with a hydraulic study for the proposed Rio Ranch Retail property located at 3705 Rio Road in unincorporated Monterey County east of California State Route 1. We understand that you received a letter from the Monterey County Water Resources Agency stating that the discretionary permit application has been deemed incomplete and that you are required to provide a Hydraulic Analysis by a registered civil engineer.

Our technical approach was to use the currently-effective Federal Emergency Management Agency (FEMA) model of the north overbank to assess the Base Flood Elevations (BFEs), also known as the 100-year elevations, at the project site in effective and post-fill placement conditions. This allowed us to compare the BFEs and to assess whether the proposed fill placement would raise the BFE more than one foot from pre-fill conditions.

Our assessment is that the proposed fill placement has a minimal effect on the 100-year water surface elevations at the project site and the changes do not propagate upstream or downstream.

The effective FEMA model for the lower section of the Carmel River is a one-dimensional HEC-RAS split reach model with unique reaches describing the main stem Carmel River and the north and south overbanks. Though the main stem reach features levees on either bank, these levees are not FEMA-accredited. As such, the 100-year floodplain is mapped as though the levees do not provide protection. The Flood Insurance Rate Map (FIRM) seen in Figure 1 shows the 100-year extents as mapped by FEMA. The project location is marked by a pin and shows that the parcel is located within the 100-year floodplain. Figure 2 shows the published Flood Insurance Study (FIS) flood profile for the north overbank with the approximate location of the project marked by red vertical bounding lines. Per the FIRM, which rounds elevations to the nearest foot, the BFE at the project site is less than 29 feet at the west edge of the property and increases to approximately 30-31 feet at the eastern edge. While the resolution is low, the flood profiles in Figure 2 confirm that the BFEs are in this range.

Mr. Douglas Wiele
June 1, 2018
Page 2

In order to holistically capture the risk, the FEMA model includes several runs to describe possible flooding scenarios. These include one run where the levees, though unaccredited, are assumed to hold during the 100-year event and do provide protection up to their crest elevation, one run where the south bank levees hold while the north bank levees breach, and a run where the south bank levees breach while the north bank levees hold. While FEMA does not disclose exactly how these runs were used to map the floodplain shown in the FIRM, a reasonable assumption is that the “worst case scenario” flooding (i.e., the highest water surface elevations) from each of the three scenarios were melded together to create the effective flooding extents. It is therefore appropriate for this analysis to also use the effective run that results in the highest water surface elevations at the project site in order to conservatively assess the impacts of the proposed fill. This run is the scenario where the south levees hold while the north levees breach.

We have used the grading plan provided by C3 Engineering (shown in Figure 3) to update the topographic base for the applicable cross-sections in the above-mentioned model run. A model schematic of the north overbank with the cross-sections labeled is included in Figure 4. Two cross-sections (4966 and 4796) required topographic base updates. While cross-section 4631 was just outside of the grading limits, an ineffective flow area was added to the section to account for the effect of the fill just upstream. No other updates were made to the model (such as to roughness coefficients) in order to isolate the effect of the proposed fill.

Table 1 below lists the model cross-sections that describe the north overbank in the FEMA model, their associated BFEs in effective and post-fill placement conditions, and the difference between the two values. Please note that effective FEMA model was developed using the National Geodetic Vertical Datum of 1929 (NGVD 29). Per the effective Flood Insurance Study (FIS), the conversion between NGVD 29 and the more commonly used North American Vertical Datum of 1988 (NAVD 88) is +2.75 feet. Table 1 reports the values in NAVD 88 so that it can be compared to the values published on the FIRM and in the FIS profiles.

Mr. Douglas Wiele

 Page 3

Table 1. Difference in BFE between the effective and post-fill model in the north overbank.

Mode Cross-Section	Effective BFE	Post-Fill BFE	Change
	(ft, NAVD 88)	(ft, NAVD 88)	(ft)
6708	37.62	37.62	0.00
6636	37.10	37.10	0.00
6557	35.06	35.06	0.00
6208	34.97	34.97	0.00
5826	34.79	34.79	0.00
5470	34.01	34.01	0.00
5275	32.75	32.75	0.00
4966	28.47	28.51	+0.04
4796	28.35	28.36	+0.01
4631	28.21	28.21	0.00
4458	28.16	28.16	0.00
4362	28.15	28.15	0.00
4243	28.14	28.14	0.00

The effect of the fill is minimal and does not propagate upstream or downstream of the project. This is, in part, due to the long cross-sections that span the entire north overbank. The cross-sections have more than enough flow area to distribute the effect of the proposed fill.

Obtaining concurrence from the Monterey County Water Resources Agency that the proposed development does not increase the water surface elevation of the BFE more than one foot does not eliminate the need for the property owner to pay flood insurance under the National Flood Insurance Program. In order to remove the property or portions of the property out of the FEMA-designated floodplain, a Conditional Letter of Map Revision Based on Fill (CLORM-F) would need to be submitted to FEMA. This submittal would provide information to, and would be reviewed by, FEMA staff for their determination that the proposed fill placement would comply with the NFIP. Post-construction, final official removal of parts of the property from the SFHA would require subsequent submittal of a LOMR-F application to FEMA. This is generally a routine process that does not require additional hydraulic modeling work as long as the fill is placed in conformance with the configuration used in the CLORM-F. It is important to note that both submittals carry an application fee and the FEMA review process may take up to several months from the time that they have all the information they may request.

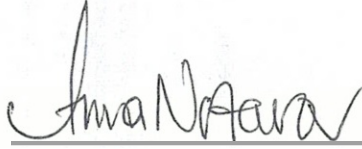

Closing

Thank you again for requesting this analysis. Please do not hesitate to contact Balance if you have any further questions.

Mr. Douglas Wiele

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The base map shown complies with FEMA's base map accuracy standards.

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 6/1/2018 at 3:53:06 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: base map imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Home (/) > Programs (/programs/) > Environmental Review (/programs/environmental-review/) > DNL Calculator

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/).

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location
- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
 - **Contact your Field or Regional Environmental Officer** (</programs/environmental-review/hud-environmental-staff-contacts/>)
 - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
 - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
 - Incorporate natural or man-made barriers. See *The Noise Guidebook* (</resource/313/hud-noise-guidebook/>)
 - Construct noise barrier. See the **Barrier Performance Module** (</programs/environmental-review/bpm-calculator/>)

Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location
- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
 - **Contact your Field or Regional Environmental Officer** (</programs/environmental-review/hud-environmental-staff-contacts/>)
 - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
 - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
 - Incorporate natural or man-made barriers. See *The Noise Guidebook* (</resource/313/hud-noise-guidebook/>)
 - Construct noise barrier. See the **Barrier Performance Module** (</programs/environmental-review/bpm-calculator/>)

Day/Night Noise Level Assessment Tool Flowcharts (</resource/3823/day-night-noise-level-assessment-tool-flowcharts/>)

Vibration Analysis

$$PPV \text{ (in/sec)} = PPV \text{ (ref)} * (25/D)^{1.5}$$

Where PPV = Peak Particle Velocity
(ref) = PPV at the reference distance of 25 feet
D = distance to the receptor

Equipment = Large Dozer

$$PPV(\text{ref}) = 0.089 \text{ in/sec}$$

$$D = 80 \text{ feet}$$

$$PPV \text{ at receptor} = 0.016 \text{ in/sec}$$

PPV is 1.7x to 6x larger than RMS velocity
Assume typical conversion factor of 4 PPV:RMS

$$\text{Therefore estimated RMS velocity} = 0.004 \text{ in/sec}$$

$$\text{Receptor Lv} = 72 \text{ VdB}$$

Equipment = Loaded truck

$$PPV(\text{ref}) = 0.076 \text{ in/sec}$$

$$D = 80 \text{ feet}$$

$$PPV \text{ at receptor} = 0.013 \text{ in/sec}$$

PPV is 1.7x to 6x larger than RMS velocity
Assume typical conversion factor of 4 PPV:RMS

$$\text{Therefore estimated RMS velocity} = 0.003 \text{ in/sec}$$

$$\text{Receptor Lv} = 70 \text{ VdB}$$

Source: Chapter 12 Noise and Vibration During Construction in
Transit Noise and Vibration Assessment, April 1995
Harris Miller Miller & Hanson, Inc.
Prepared For: USDOT Federal Transit Administration

Vibration Source Levels For Construction Equipment

Equipment	PPV at 25 ft (in/sec)	Approximate Lv at 25 feet *
Impact Pile Drive upper range	1.518	112
typical	0.644	104
Sonic Pile Drive upper range	0.734	105
typical	0.17	93
drop (slurry wall)	0.202	94
Hydromill in soil	0.008	66
(slurry wall in rock)	0.017	75
Vibratory Roller	0.21	94
Hoe Ram	0.089	87
large	0.089	87
Bulldozer small	0.003	58
Caisson drilling	0.089	87
Loaded trucks	0.076	86
Jackhammer	0.035	79

School Building

* RMS Velocity in decibels VdB with Vref of 1E-6 in/sec and PPV:RMS of ~4

Criterion

US Bureau of Mines, 1971	
PPV, in/sec	Degree of Damage
<2	Safe
2 - 4	Plaster Cracking
4 - 7	Minor Damage
>7	Major Damage

Canmet, Bauer, and Calder, 1977		
Equipment	PPV Threshold, in/sec	Type of Damage
Rigid Mercury Switches	0.5	Trip Out
House	2	Cracked Plaster
Concrete Block	8	Crack in Block
Cased Drill Holes	15	Horizontal Offset
Pumps, Compressors	40	Shaft Misalignment

Human Response Criteria

Level, Lv in VdB	Equivalent Noise Level, dBA		Human Response
	Low Freq (30Hz)	Hi Freq (60 Hz)	
65	25	40	Approximate threshold of perception, low-freq inaudible, but mid-freq excessive for sleeping
75	35	50	Approx. dividing line between barely perceptible and clearly perceptible. Annoying vibration for most people. Low-freq acceptable for sleeping areas.
85	45	60	Vibration acceptable only if no more than 2 events/day for residential uses. Low-freq annoying in sleeping areas; mid-freq unacceptable for sensitive uses, including schools and churches.
90	50	65	Difficulty with tasks such as reading computer screens. Generally annoying for commercial uses.

Impact Criteria

Land Use	Lv in VdB		
	Frequent Events (70+/day)	Occasional Events (30-70)	Infrequent (<30 events/day)
Category 1: Vibration Sensitive	65	65	65
Concert Halls	65	65	65
TV Studios	65	65	65
Recording Studios	65	65	65
Category 2: Residences, hotels, sleeping areas	72	75	80
Auditoriums	72	80	80
Theaters	72	80	80
Category 3: Institutional with primarily daytime use only	75	78	83
